LELAND BLANK | ANTHONY TARQUIN

Format for Spreadsheet Functions on Excel®

Present worth:	Contents of ()
= PV (<i>i</i> %, <i>n</i> , <i>A</i> , <i>F</i>)	for constant <i>A</i> series; single <i>F</i> value
= NPV (<i>i</i> %, second_cell:last_cell) + first_cell	for varying cash flow series
Future worth:	
= FV (<i>i</i> %, <i>n</i> , <i>A</i> , <i>P</i>)	for constant <i>A</i> series; single <i>P</i> value
Annual worth:	
= PMT (<i>i</i> %, <i>n</i> , <i>P</i> , <i>F</i>)	for single amounts with no <i>A</i> series
= PMT (<i>i</i> %, <i>n</i> , NPV)	to find AW from NPV; embed NPV function
Number of periods (years):	
= NPER (<i>i</i> %, <i>A</i> , <i>P</i> , <i>F</i>)	for constant <i>A</i> series; single <i>P</i> and <i>F</i>
(Note: The PV, FV, and PMT functions change the sense of the sign. Place a minus in front of the function to retain the same sign.)	
Rate of return:	
= RATE (<i>n</i> , <i>A</i> , <i>P</i> , <i>F</i>)	for constant <i>A</i> series; single <i>P</i> and <i>F</i>
= IRR (first_cell:last_cell)	for varying cash flow series
Interest rate:	
= EFFECT (<i>r</i> %, <i>m</i>)	for nominal <i>r</i> , compounded <i>m</i> times per period
= NOMINAL (<i>i</i> %, <i>m</i>)	for effective annual <i>i</i> , compounded <i>m</i> times per year
Depreciation:	
= SLN (<i>P</i> , <i>S</i> , <i>n</i>)	straight line depreciation for each period
= DDB (<i>P</i> , <i>S</i> , <i>n</i> , <i>t</i> , <i>d</i>)	double declining balance depreciation for period <i>t</i> at rate <i>d</i> (optional)
= DB (<i>P</i> , <i>S</i> , <i>n</i> , <i>t</i>)	declining balance, rate determined by the function
= VBD (<i>P</i> , 0 , <i>n</i> , MAX(0,t-1.5) , MIN(n,t-0.5) , <i>d</i>)	MACRS depreciation for year <i>t</i> at rate <i>d</i> for DDB or DB method
Logical IF function:	
= IF (logical_test , value_if_true , value_if_false)	for logical two-branch operations

Relations for Discrete Cash Flows with End-of-Period Compounding

Type	Find/Given	Factor Notation and Formula	Relation	Sample Cash Flow Diagram
Single Amount	F/P Compound amount	$(F/P, i, n) = (1 + i)^n$	$F = P(F/P, i, n)$	
	P/F Present worth	$(P/F, i, n) = \frac{1}{(1+i)^n}$	$P = F(P/F, i, n)$ (Sec. 2.1)	
Uniform Series	P/A Present worth	$(P/A, i, n) = \frac{(1+i)^n - 1}{i(1+i)^n}$	$P = A(P/A, i, n)$	
	A/P Capital recovery	$(A/P, i, n) = \frac{i(1+i)^n}{(1+i)^n - 1}$	$A = P(A/P, i, n)$ (Sec. 2.2)	
	F/A Compound amount	$(F/A, i, n) = \frac{(1+i)^n - 1}{i}$	$F = A(F/A, i, n)$	
	A/F Sinking fund	$(A/F, i, n) = \frac{i}{(1+i)^n - 1}$	$A = F(A/F, i, n)$ (Sec. 2.3)	
Arithmetic Gradient	P_G/G Present worth	$(P/G, i, n) = \frac{(1+i)^n - in - 1}{i^2(1+i)^n}$	$P_G = G(P/G, i, n)$	
	A_G/G Uniform series (Gradient only)	$(A/G, i, n) = \frac{1}{i} - \frac{n}{(1+i)^n - 1}$ (Gradient only)	$A_G = G(A/G, i, n)$ (Sec. 2.5)	
Geometric Gradient	P_g/A_1 and g Present worth	$P_g = \begin{cases} \frac{A_1 \left[1 - \left(\frac{1+g}{1+i} \right)^n \right]}{i-g} & g \neq i \\ A_1 \frac{n}{1+i} & g = i \end{cases}$ (Gradient and base A_1)	$g \neq i$ $g = i$ (Sec. 2.6)

McGraw-Hill Connect® Learn Without Limits

Connect is a teaching and learning platform that is proven to deliver better results for students and instructors.

Connect empowers students by continually adapting to deliver precisely what they need, when they need it, and how they need it, so your class time is more engaging and effective.

73% of instructors who use **Connect** require it; instructor satisfaction **increases by 28%** when **Connect** is required.

Connect's Impact on Retention Rates, Pass Rates, and Average Exam Scores

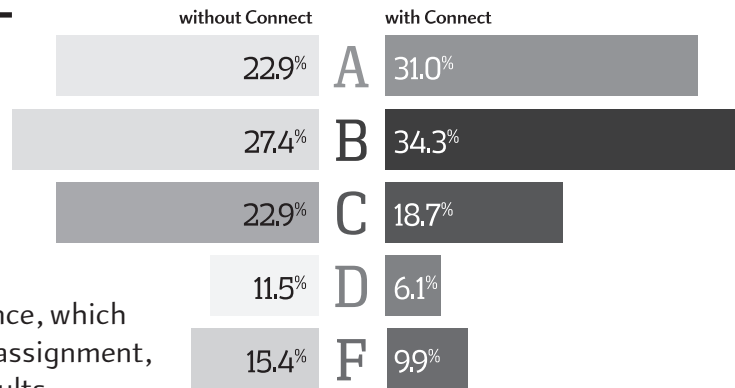

Using **Connect** improves retention rates by **19.8%**, passing rates by **12.7%**, and exam scores by **9.1%**.

Analytics

Connect Insight®

Connect Insight is Connect's new one-of-a-kind visual analytics dashboard—now available for both instructors and students—that provides at-a-glance information regarding student performance, which is immediately actionable. By presenting assignment, assessment, and topical performance results together with a time metric that is easily visible for aggregate or individual results, Connect Insight gives the user the ability to take a just-in-time approach to teaching and learning, which was never before available. Connect Insight presents data that empowers students and helps instructors improve class performance in a way that is efficient and effective.

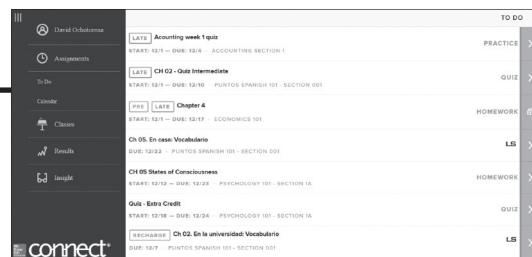

Impact on Final Course Grade Distribution

Students can view their results for any **Connect** course.

Mobile

Connect's new, intuitive mobile interface gives students and instructors flexible and convenient, anytime-anywhere access to all components of the Connect platform.

Adaptive

THE ADAPTIVE READING EXPERIENCE DESIGNED TO TRANSFORM THE WAY STUDENTS READ

More students earn **A's** and **B's** when they use McGraw-Hill Education **Adaptive** products.

SmartBook[®]

Proven to help students improve grades and study more efficiently, SmartBook contains the same content within the print book, but actively tailors that content to the needs of the individual. SmartBook's adaptive technology provides precise, personalized instruction on what the student should do next, guiding the student to master and remember key concepts, targeting gaps in knowledge and offering customized feedback, and driving the student toward comprehension and retention of the subject matter. Available on tablets, SmartBook puts learning at the student's fingertips—anywhere, anytime.

Over **8 billion** questions have been answered, making McGraw-Hill Education products more intelligent, reliable, and precise.

www.mheducation.com

STUDENTS WANT

 **SMARTBOOK[®]**

of students reported **SmartBook** to be a more effective way of reading material.

of students want to use the Practice Quiz feature available within **SmartBook** to help them study.

of students reported having reliable access to off-campus wifi.

of students say they would purchase **SmartBook** over print alone.

of students reported that **SmartBook** would impact their study skills in a positive way.

CONTENTS

Preface to Eighth Edition xiv

LEARNING STAGE 1

THE FUNDAMENTALS

Chapter 1	Foundations of Engineering Economy	2
1.1	Why Engineering Economy and the Time Value of Money are Important	3
1.2	Performing an Engineering Economy Study	5
1.3	Professional Ethics and Economic Decisions	7
1.4	Interest Rate and Rate of Return	10
1.5	Terminology and Symbols	14
1.6	Cash Flows: Estimation and Diagramming	15
1.7	Economic Equivalence	19
1.8	Simple and Compound Interest	22
1.9	Minimum Attractive Rate of Return	26
1.10	Introduction to Spreadsheet Use	27
	Chapter Summary	31
	Problems	31
	Exercises for Spreadsheets	35
	Additional Problems and FE Exam Review Questions	36
	Case Study—Cost of Electricity with Renewable Sources Added	37
Chapter 2	Factors: How Time and Interest Affect Money	38
PE	Progressive Example—The Steel Plant Case	39
2.1	Single-Amount Factors (F/P and P/F)	39
2.2	Uniform Series Present Worth Factor and Capital Recovery Factor (P/A and A/P)	43
2.3	Sinking Fund Factor and Uniform Series Compound Amount Factor (A/F and F/A)	46
2.4	Factor Values for Untabulated i or n Values	48
2.5	Arithmetic Gradient Factors (P/G and A/G)	50
2.6	Geometric Gradient Series Factors	58
2.7	Determining i or n for Known Cash Flow Values	61
	Chapter Summary	64
	Problems	64
	Exercises for Spreadsheets	68
	Additional Problems and FE Exam Review Questions	69
	Case Study—The Amazing Impact of Compound Interest	71
Chapter 3	Combining Factors and Spreadsheet Functions	72
3.1	Calculations for Uniform Series That Are Shifted	73
3.2	Calculations Involving Uniform Series and Randomly Placed Single Amounts	76
3.3	Calculations for Shifted Gradients	80
	Chapter Summary	86
	Problems	86
	Exercises for Spreadsheets	92
	Additional Problems and FE Exam Review Questions	93
	Case Study—Preserving Land for Public Use	94
Chapter 4	Nominal and Effective Interest Rates	96
PE	Progressive Example—The Credit Card Offer Case	97
4.1	Nominal and Effective Interest Rate Statements	98

4.2	Effective Annual Interest Rates	101
4.3	Effective Interest Rates for Any Time Period	107
4.4	Equivalence Relations: Payment Period and Compounding Period	108
4.5	Equivalence Relations: Single Amounts with $PP \geq CP$	109
4.6	Equivalence Relations: Series with $PP \geq CP$	111
4.7	Equivalence Relations: Single Amounts and Series with $PP < CP$	115
4.8	Effective Interest Rate for Continuous Compounding	116
4.9	Interest Rates That Vary Over Time	118
	Chapter Summary	120
	Problems	120
	Exercises for Spreadsheets	125
	Additional Problems and FE Exam Review Questions	125
	Case Study—Is Owning a Home a Net Gain or Net Loss Over Time?	127

LEARNING
STAGE 2

BASIC ANALYSIS TOOLS

Chapter 5	Present Worth Analysis	130
	PE Progressive Example—Water for Semiconductor Manufacturing Case	131
5.1	Formulating Alternatives	131
5.2	Present Worth Analysis of Equal-Life Alternatives	133
5.3	Present Worth Analysis of Different-Life Alternatives	135
5.4	Future Worth Analysis	139
5.5	Capitalized Cost Analysis	140
	Chapter Summary	144
	Problems	144
	Exercises for Spreadsheets	149
	Additional Problems and FE Exam Review Questions	150
	Case Study—Comparing Social Security Benefits	152
Chapter 6	Annual Worth Analysis	154
6.1	Advantages and Uses of Annual Worth Analysis	155
6.2	Calculation of Capital Recovery and AW Values	157
6.3	Evaluating Alternatives by Annual Worth Analysis	159
6.4	AW of a Permanent Investment	161
6.5	Life-Cycle Cost Analysis	164
	Chapter Summary	168
	Problems	168
	Exercises for Spreadsheets	173
	Additional Problems and FE Exam Review Questions	175
	Case Study—Annual Worth Analysis—Then and Now	176
Chapter 7	Rate of Return Analysis: One Project	178
7.1	Interpretation of a Rate of Return Value	179
7.2	Rate of Return Calculation Using a PW or AW Relation	181
7.3	Special Considerations When Using the ROR Method	185
7.4	Multiple Rate of Return Values	186
7.5	Techniques to Remove Multiple Rates of Return	191
7.6	Rate of Return of a Bond Investment	197
	Chapter Summary	200
	Problems	200

	Exercises for Spreadsheets	205
	Additional Problems and FE Exam Review Questions	207
	Case Study—Developing and Selling an Innovative Idea	209
Chapter 8	Rate of Return Analysis: Multiple Alternatives	210
8.1	Why Incremental Analysis Is Necessary	211
8.2	Calculation of Incremental Cash Flows for ROR Analysis	211
8.3	Interpretation of Rate of Return on the Extra Investment	214
8.4	Rate of Return Evaluation Using PW: Incremental and Breakeven (Two Alternatives)	215
8.5	Rate of Return Evaluation Using AW	221
8.6	Incremental ROR Analysis of Multiple (More than Two) Alternatives	222
8.7	All-in-One Spreadsheet Analysis	226
	Chapter Summary	228
	Problems	228
	Exercises for Spreadsheets	233
	Additional Problems and FE Exam Review Questions	234
	Case Study—Performing ROR Analysis for 3D Printer and IIoT Technology	235
	Case Study—How a New Engineering Graduate Can Help His Father	236
Chapter 9	Benefit/Cost Analysis and Public Sector Economics	238
PE	Progressive Example—Water Treatment Facility #3 Case	239
9.1	Public Sector Projects	240
9.2	Benefit/Cost Analysis of a Single Project	245
9.3	Incremental B/C Analysis (Two Alternatives)	248
9.4	Incremental B/C Analysis of Multiple (More than Two) Alternatives	252
9.5	Service Sector Projects and Cost-Effectiveness Analysis	256
9.6	Ethical Considerations in the Public Sector	260
	Chapter Summary	261
	Problems	262
	Exercises for Spreadsheets	269
	Additional Problems and FE Exam Review Questions	270
	Case Study—Highway Lighting Options to Reduce Traffic Accidents	272

**LEARNING
STAGE 2**
EPILOGUE: SELECTING THE BASIC ANALYSIS TOOL
**LEARNING
STAGE 3**
MAKING BETTER DECISIONS

Chapter 10	Project Financing and Noneconomic Attributes	278
10.1	MARR Relation to the Cost of Capital	279
10.2	Debt-Equity Mix and Weighted Average Cost of Capital	281
10.3	Determination of the Cost of Debt Capital	283
10.4	Determination of the Cost of Equity Capital and the MARR	285
10.5	Effect of Debt-Equity Mix on Investment Risk	287
10.6	Multiple Attribute Analysis: An Introduction	290
10.7	Evaluation Measure for Multiple Attributes	294
	Chapter Summary	295
	Problems	296
	Exercises for Spreadsheets	301
	Additional Problems and FE Exam Review Questions	302
	Case Study—Expanding a Business—Debt vs. Equity Financing?	303

Chapter 11	Replacement and Retention Decisions	304
	PE Progressive Example—Keep or Replace the Kiln Case	305
	11.1 Basics of a Replacement Study	306
	11.2 Economic Service Life	308
	11.3 Performing a Replacement Study	314
	11.4 Additional Considerations in a Replacement Study	318
	11.5 Replacement Study over a Specified Study Period	319
	11.6 Replacement Value	324
	Chapter Summary	324
	Problems	325
	Exercises for Spreadsheets	331
	Additional Problems and FE Exam Review Questions	331
	Case Study—A Pumper System with an ESL Problem	333
Chapter 12	Independent Projects with Budget Limitation	334
	12.1 An Overview of Capital Rationing among Projects	335
	12.2 Capital Rationing Using PW Analysis of Equal-Life Projects	337
	12.3 Capital Rationing Using PW Analysis of Unequal-Life Projects	339
	12.4 Capital Budgeting Problem Formulation Using Linear Programming	341
	12.5 Additional Project Ranking Measures	344
	Chapter Summary	346
	Problems	346
	Additional Problems and FE Exam Review Questions	351
Chapter 13	Breakeven and Payback Analysis	354
	13.1 Breakeven Analysis for a Single Project	355
	13.2 Breakeven Analysis Between Two Alternatives	359
	13.3 Payback Analysis	362
	13.4 More Breakeven and Payback Analysis on Spreadsheets	366
	Chapter Summary	369
	Problems	369
	Exercises for Spreadsheets	374
	Additional Problems and FE Exam Review Questions	375
	Case Study—Water Treatment Plant Process Costs	376

**LEARNING
STAGE 4**
ROUNDING OUT THE STUDY

Chapter 14	Effects of Inflation	380
	14.1 Understanding the Impact of Inflation	381
	14.2 Present Worth Calculations Adjusted for Inflation	383
	14.3 Future Worth Calculations Adjusted for Inflation	388
	14.4 Capital Recovery Calculations Adjusted for Inflation	391
	Chapter Summary	392
	Problems	392
	Additional Problems and FE Exam Review Questions	398
	Case Study—Inflation Considerations for Stock and Bond Investments	399
Chapter 15	Cost Estimation and Indirect Cost Allocation	400
	15.1 Understanding How Cost Estimation Is Accomplished	401
	15.2 Unit Method	404
	15.3 Cost Indexes	405

15.4	Cost-Estimating Relationships: Cost-Capacity Equations	408
15.5	Cost-Estimating Relationships: Factor Method	409
15.6	Indirect Cost Rates and Allocation: The Traditional Method	411
15.7	Activity-Based Costing (ABC) for Indirect Costs	415
15.8	Making Estimates and Maintaining Ethical Practices	417
	Chapter Summary	418
	Problems	418
	Additional Problems and FE Exam Review Questions	424
	Case Study—Indirect Cost Analysis of Medical Equipment Manufacturing Costs	425
	Case Study—Deceptive Acts Can Get You in Trouble	427
Chapter 16	Depreciation Methods	428
16.1	Depreciation Terminology	429
16.2	Straight Line (SL) Depreciation	432
16.3	Declining Balance (DB) and Double Declining Balance (DDB) Depreciation	433
16.4	Modified Accelerated Cost Recovery System (MACRS)	436
16.5	Determining the MACRS Recovery Period	440
16.6	Depletion Methods	441
	Chapter Summary	443
	Appendix	444
16A.1	Sum-of-Years-Digits (SYD) and Unit-of-Production (UOP) Depreciation	444
16A.2	Switching between Depreciation Methods	446
16A.3	Determination of MACRS Rates	449
	Problems	452
	Additional Problems and FE Exam Review Questions	455
	Appendix Problems	456
Chapter 17	After-Tax Economic Analysis	458
17.1	Income Tax Terminology and Basic Relations	459
17.2	Calculation of Cash Flow after Taxes	462
17.3	Effect on Taxes of Different Depreciation Methods and Recovery Periods	464
17.4	Depreciation Recapture and Capital Gains (Losses)	467
17.5	After-Tax Economic Evaluation	470
17.6	After-Tax Replacement Study	476
17.7	After-Tax Value-Added Analysis	479
17.8	After-Tax Analysis for International Projects	482
17.9	Value-Added Tax	484
	Chapter Summary	486
	Problems	487
	Additional Problems and FE Exam Review Questions	496
	Case Study—After-Tax Analysis for Business Expansion	497
Chapter 18	Sensitivity Analysis and Staged Decisions	498
18.1	Determining Sensitivity to Parameter Variation	499
18.2	Sensitivity Analysis Using Three Estimates	504
18.3	Estimate Variability and the Expected Value	505
18.4	Expected Value Computations for Alternatives	506
18.5	Staged Evaluation of Alternatives Using a Decision Tree	508
18.6	Real Options in Engineering Economics	512
	Chapter Summary	517
	Problems	517
	Additional Problems and FE Exam Review Questions	524
	Case Study—Sensitivity to the Economic Environment	525
	Case Study—Sensitivity Analysis of Public Sector Projects—Water Supply Plans	525

Chapter 19	More on Variation and Decision Making under Risk	528
19.1	Interpretation of Certainty, Risk, and Uncertainty	529
19.2	Elements Important to Decision Making under Risk	532
19.3	Random Samples	537
19.4	Sample Estimates: Mean and Standard Deviation	540
19.5	Monte Carlo Sampling and Simulation Analysis	547
	Chapter Summary	554
	Problems	554
	Additional Problems and FE Exam Review Questions	558
	Case Study—Using Simulation and Three-Estimate Sensitivity Analysis	559
Appendix A	Using Spreadsheets and Microsoft Excel®	561
A.1	Introduction to Using Excel	561
A.2	Organization (Layout) of the Spreadsheet	563
A.3	Spreadsheet Functions Important to Engineering Economy (Alphabetical Order)	564
A.4	Goal Seek—A Tool for Breakeven and Sensitivity Analysis	572
A.5	Solver—An Optimizing Tool for Capital Budgeting, Breakeven, and Sensitivity Analysis	573
A.6	Error Messages	574
Appendix B	Basics of Accounting Reports and Business Ratios	575
B.1	The Balance Sheet	575
B.2	Income Statement and Cost of Goods Sold Statement	576
B.3	Business Ratios	577
Appendix C	Code of Ethics for Engineers	580
Appendix D	Alternate Methods for Equivalence Calculations	583
D.1	Using Programmable Calculators	583
D.2	Using the Summation of a Geometric Series	584
Appendix E	Glossary of Concepts and Terms	587
E.1	Important Concepts and Guidelines	587
E.2	Symbols and Terms	590
<i>Reference Materials</i>	593	
<i>Factor Tables</i>	595

PREFACE TO EIGHTH EDITION

This new edition includes the time-tested approach and topics of previous editions and introduces significantly new print and electronic features useful to learning about and successfully applying the exciting field of engineering economics. Money makes a huge difference in the life of a corporation, an individual, and a government. Learning to understand, analyze, and manage the money side of any project is vital to its success. To be professionally successful, every engineer must be able to deal with the time value of money, economic facts, inflation, cost estimation, tax considerations, as well as spreadsheet and calculator use. This book is a great help to the learner and the instructor in accomplishing these goals by using easy-to-understand language, simple graphics, and online features.

What's New and What's Best ●●●

This eighth edition has new digital features and retains the time-tested features that make the book reliable and easy to use. Plus the supporting online materials are updated to enhance the teaching and learning experience.

Exciting new features in print:

- All new end-of-chapter problems
- Expanded questions for either review or preparation for the Fundamentals of Engineering (FE) Exam

Valuable new features in digital content:

- McGraw-Hill Connect
 - Online video presentations with closed captioning to serve as learning support tools
 - Algorithmic end-of-chapter problems that present a new set of parameters and estimates every time the problem is opened
 - SmartBook, an adaptive reading experience

Familiar features retained in this edition:

- Easy-to-read language
- End-of-chapter case studies
- Ethical considerations in economic analyses
- Progressive examples for improved understanding of concepts
- Hand and spreadsheet example solutions
- Spreadsheet solutions with on-image comments and Excel® functions
- Vital concepts and guidelines located in margins and appendix
- Flexible chapter ordering

How to Use This Text ●●●

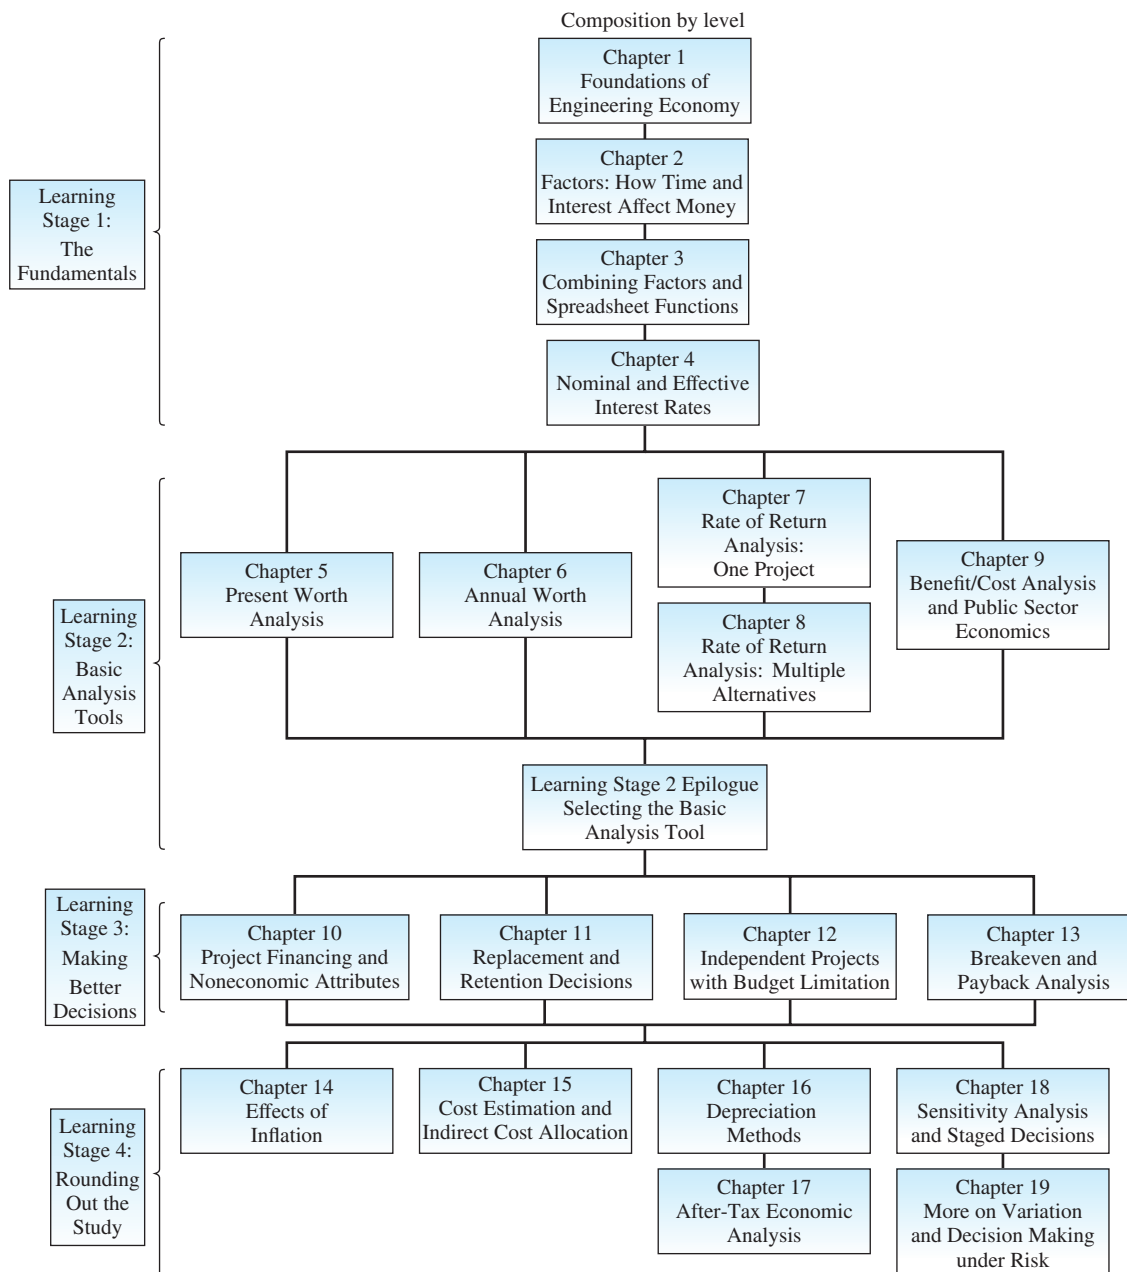

This textbook is best suited for a one-semester or one-quarter undergraduate course. Students should be at the sophomore level or above with a basic understanding of engineering concepts and terminology. A course in calculus is not necessary; however, knowledge of the concepts in advanced mathematics and elementary probability will make the topics more meaningful.

Practitioners and professional engineers who need a refresher in economic analysis and cost estimation will find this book very useful as a reference document as well as a learning medium.

Chapter Organization and Coverage Options ●●●

The textbook contains 19 chapters arranged into four learning stages, *as indicated in the flowchart* on the next page, and five appendices. Each chapter starts with a statement of purpose and specific learning outcomes for each section. Chapters include a summary, numerous end-of-chapter

CHAPTERS IN EACH LEARNING STAGE

problems (essay and numerical), multiple-choice problems useful for course review and FE Exam preparation, and a case study.

The appendices are important elements of learning for this text:

Appendix A Using Spreadsheets and Microsoft Excel®

Appendix B Basics of Accounting reports and business ratios

Appendix C Code of Ethics for Engineers (from NSPE)

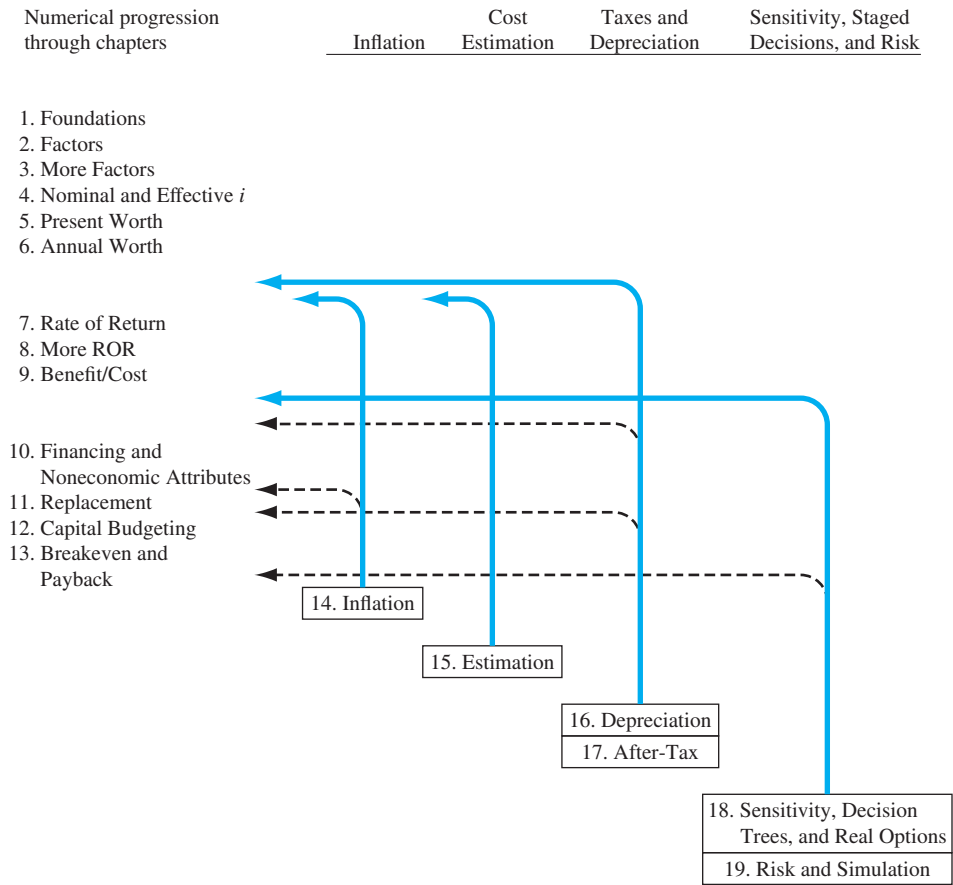

Appendix D Alternate methods for equivalence calculations

Appendix E Glossary of concepts and terms

There is considerable flexibility in the sequencing of topics and chapters once the first six chapters are covered, as shown in the progression graphic on the next page. If the course is designed to emphasize sensitivity and risk analysis, Chapters 18 and 19 can be covered immediately after

CHAPTER AND TOPIC PROGRESSION OPTIONS

Topics may be introduced at the point indicated or any point thereafter
(Alternative entry points are indicated by ←---)

Learning Stage 2 (Chapter 9) is completed. If depreciation and tax emphasis are vitally important to the goals of the course, Chapters 16 and 17 can be covered once Chapter 6 (annual worth) is completed. The progression graphic can help in the design of the course content and topic ordering.

Resources for Instructors and Students ●●●

LEARNING OUTCOMES:

- Each chapter begins with a purpose, list of topics, and learning outcomes (ABET style) for each corresponding section. This behavioral-based approach sensitizes the reader to what is ahead, leading to improved understanding and learning.

CONCEPTS AND GUIDELINES:

- To highlight the fundamental building blocks of the course, a checkmark and title in the margin call attention to particularly important concepts and decision-making guidelines. Appendix E includes a brief description of each fundamental concept.

IN-CHAPTER EXAMPLES:

- Numerous in-chapter examples throughout the book reinforce the basic concepts and make understanding easier. In many cases, the example is solved using separately marked hand and spreadsheet solutions.

PE PROGRESSIVE EXAMPLES:

- Several chapters include a progressive example—a more detailed problem statement introduced at the beginning of the chapter and expanded upon throughout the chapter in specially marked examples. This approach illustrates different techniques and some increasingly complex aspects of a real-world problem.

**ONLINE PRESENTATIONS:**

- An icon in the margin indicates the availability of an animated voice-over slide presentation that summarizes the material in the section and provides a brief example for learners who need a review or prefer video-based materials. Presentations are keyed to the sections of the text.

SPREADSHEETS:

- The text integrates spreadsheets to show how easy they are to use in solving virtually any type of engineering economic analysis problem. Cell tags or full cells detail built-in functions and relations developed to solve a specific problem.

FE EXAM AND COURSE REVIEWS:

- Each chapter concludes with several multiple-choice, FE Exam–style problems that provide a simplified review of chapter material. Additionally, these problems cover topics for test reviews and homework assignments.

Digital Resources ● ● ●**ALGORITHMIC END-OF-CHAPTER PROBLEMS:**

- Available through the online homework platform Connect, algorithmic end-of-chapter problems can be assigned for homework, practice, exams, or quizzes. Problems include algorithmically generated values so that each student receives different numbers, while responses are auto-graded to provide immediate feedback to the student.

SMARTBOOK:

- Also available through Connect is SmartBook which contains the same content within the print book, but actively tailors that content to the needs of the individual. SmartBook’s adaptive technology provides precise, personalized instruction on what the student should do next, guiding the student to master and remember key concepts, targeting gaps in knowledge and offering customized feedback to drive the student toward comprehension and retention of the subject matter.

ACKNOWLEDGMENT OF CONTRIBUTORS

It takes the input and efforts of many individuals to make significant improvements in a textbook. We wish to give special thanks to the following persons for their contributions to this edition.

Jack Beltran, Beltran and Associates

Neal McCollom, University of Texas at Arlington

Sallie Sheppard, Texas A&M University

If you discover errors that require correction in the next printing of the textbook or in updates of the online resources, please contact us. We hope you find the contents of this edition helpful in your academic and professional activities.

Anthony Tarquin atarquin@utep.edu

The Fundamentals

LEARNING STAGE 1 The Fundamentals

CHAPTER 1
Foundations of
Engineering Economy

CHAPTER 2
Factors: How Time
and Interest Affect
Money

CHAPTER 3
Combining Factors
and Spreadsheet
Functions

CHAPTER 4
Nominal and Effective
Interest Rates

The fundamentals of engineering economy are introduced in these chapters. When you have completed stage 1, you will be able to understand and work problems that account for the **time value of money, cash flows** occurring at different times with different amounts, and **equivalence** at different interest rates. The techniques you master here form the basis of how an engineer in any discipline can take **economic value** into account in virtually any project environment.

The factors commonly used in all engineering economy computations are introduced and applied here. Combinations of these factors assist in moving monetary values forward and backward through time and at different interest rates. Also, after these chapters, you should be comfortable using many of the spreadsheet functions.

Many of the terms common to economic decision making are introduced in learning stage 1 and used in later chapters. A checkmark icon in the margin indicates that a new **concept or guideline** is introduced at this point.

Foundations of Engineering Economy

Malcolm Fife/age fotostock

LEARNING OUTCOMES

Purpose: Understand and apply fundamental concepts and use the terminology of engineering economics.

SECTION	TOPIC	LEARNING OUTCOME
1.1	Description and role	<ul style="list-style-type: none"> Define engineering economics and the time value of money; identify areas of application.
1.2	Engineering economy study approach	<ul style="list-style-type: none"> Understand and identify the steps in an engineering economy study.
1.3	Ethics and economics	<ul style="list-style-type: none"> Identify areas in which economic decisions can present questionable ethics.
1.4	Interest rate	<ul style="list-style-type: none"> Perform calculations for interest rates and rates of return.
1.5	Terms and symbols	<ul style="list-style-type: none"> Identify and use engineering economic terminology and symbols.
1.6	Cash flows	<ul style="list-style-type: none"> Understand cash flows and how to graphically represent them.
1.7	Economic equivalence	<ul style="list-style-type: none"> Describe and calculate economic equivalence.
1.8	Simple and compound interest	<ul style="list-style-type: none"> Calculate simple and compound interest amounts for one or more time periods.
1.9	MARR and opportunity cost	<ul style="list-style-type: none"> State the meaning and role of Minimum Attractive Rate of Return (MARR) and opportunity costs.
1.10	Spreadsheet functions	<ul style="list-style-type: none"> Identify and use some Excel[®] functions commonly applied in engineering economics.

T

he need for engineering economy is primarily motivated by the work that engineers do in performing analyses, synthesizing, and coming to a conclusion as they work on projects of all sizes. In other words, engineering economy is at the heart of **making decisions**. These decisions involve the fundamental elements of **cash flows of money, time, and interest rates**. This chapter introduces the basic concepts and terminology necessary for an engineer to combine these three essential elements in organized, mathematically correct ways to solve problems that will lead to better decisions.

1.1 Why Engineering Economy and the Time Value of Money are Important ●●●

Decisions are made routinely to choose one alternative over another by engineers on the job; by managers who supervise the activities of others; by corporate presidents who operate a business; and by government officials who work for the public good. Most decisions involve money, called **capital** or **capital funds**, which is usually limited in amount. The decision of where and how to invest this limited capital is motivated by a primary goal of **adding value** as future, anticipated results of the selected alternative are realized. Engineers play a vital role in capital investment decisions based upon their ability and experience to design, analyze, and synthesize. The factors upon which a decision is based are commonly a combination of economic and noneconomic elements. Engineering economy deals with the economic factors. By definition,

Engineering economy involves formulating, estimating, and evaluating the expected economic outcomes of alternatives designed to accomplish a defined purpose. Mathematical techniques simplify the economic evaluation of alternatives.

Because the formulas and techniques used in engineering economics are applicable to all types of money matters, they are equally useful in business and government, as well as for individuals. Therefore, besides applications to projects in your future jobs, what you learn from this book and in this course may well offer you an economic analysis tool for making personal decisions such as car purchases, house purchases, and purchases on credit for enjoyment, e.g., electronics, games, drones, vacations, etc.

To be financially literate is very important as an engineer and as a person. Unfortunately many people do not have the fundamental understanding of concepts such as financial risk and diversification, inflation, numeracy, and compound interest. You will learn and apply these basic concepts, and more, through the study of engineering economy. A comprehensive Standard & Poors¹ study reported in 2015 evaluated the financial literacy of people worldwide using the survey results of more than 150,000 people interviewed in 148 countries. Results indicated that worldwide only one out of three adults are able to answer correctly three out of four simple questions that indicate an understanding in the areas mentioned above—inflation, compound interest, risk, and diversification. Scandinavian countries (e.g., Denmark, Norway, and Sweden), plus Germany, Canada, and the United Kingdom have acceptably good scores (67% to 71% financial literacy), the United States is mediocre at 57% (14th worldwide), while countries such as Cambodia, Armenia, and Haiti are low (15% to 18%). An obvious conclusion is that a college graduate in engineering anywhere in the world must be financially literate to responsibly and successfully function in his or her professional and personal activities.

Other terms that mean the same as *engineering economy* are *engineering economic analysis*, *capital allocation study*, *economic analysis*, and similar descriptors.

People make decisions; computers, mathematics, concepts, and guidelines assist people in their decision-making process. Since most decisions affect what will be done, the time frame of engineering economy is primarily the **future**. Therefore, the numbers used in engineering economy are **best estimates of what is expected to occur**. The estimates and the decision usually involve four essential elements:

Cash flows

Times of occurrence of cash flows

Interest rates for time value of money

Measure of worth for selecting an alternative

¹Klapper, L., Lusardi, A., and van Oudheusden, P. “Financial Literacy around the World: Insights from the Standard & Poor’s Ratings Services Global Financial Literacy Survey”, 2015, Standards & Poors, and Gallup World Poll. (accessed December 2015). <http://www.finlit.mhfi.com>.

Since the estimates of cash flow amounts and timing are about the future, they will be somewhat different than what is actually observed, due to changing circumstances and unplanned events. In short, the variation between an amount or time estimated now and that observed in the future is caused by the stochastic (random) nature of all economic events. **Sensitivity analysis** is utilized to determine how a decision might change according to varying estimates, especially those expected to vary widely.

The criterion used to select an alternative in engineering economy for a specific set of estimates is called a **measure of worth**. The measures developed and used in this text are

Present worth (PW)	Future worth (FW)	Annual worth (AW)
Rate of return (ROR)	Benefit/cost (B/C)	Capitalized cost (CC)
Payback period	Profitability index	Economic value added (EVA)

All these measures of worth account for the fact that money makes money over time. This is the concept of the **time value of money**.

Time value of money

It is a well-known fact that money **makes** money. The time value of money explains the change in the amount of money **over time** for funds that are owned (invested) or owed (borrowed). **This is the most important concept in engineering economy.**

The time value of money is very obvious in the world of economics. If we decide to invest capital (money) in a project today, we inherently expect to have more money in the future than we invested. If we borrow money today, in one form or another, we expect to return the original amount plus some additional amount of money. An engineering economic analysis can be performed on future estimated amounts or on past cash flows to determine if a specific measure of worth, e.g., rate of return, was achieved.

Engineering economics is applied in an extremely wide variety of situations. Samples are:

- Equipment purchases and leases
- Chemical processes
- Cyber security
- Construction projects
- Airport design and operations
- Sales and marketing projects
- Transportation systems of all types
- Product design
- Wireless and remote communication and control
- Manufacturing processes
- Safety systems
- Hospital and healthcare operations
- Quality assurance
- Government services for residents and businesses

In short, any activity that has money associated with it—which is just about everything—is a reasonable topic for an engineering economy study.

EXAMPLE 1.1

Cyber security is an increasingly costly dimension of doing business for many retailers and their customers who use credit and debit cards. A 2014 data breach of U.S.-based Home Depot involved some 56 million cardholders. Just to investigate and cover the immediate direct costs of this identity theft amounted to an estimated \$62,000,000, of which \$27,000,000 was recovered by insurance company payments. This does not include indirect costs, such as, lost future business, costs to banks, and cost to replace cards. If a cyber security vendor had proposed in 2006 that a \$10,000,000 investment in a malware detection system could guard the company's computer and payment systems from such a breach, would it have kept up with the rate of inflation estimated at 4% per year?

Solution

As a result of this data breach, Home Depot experienced a direct out-of-pocket cost of \$35,000,000 after insurance payments. In this chapter and in Chapter 2, you will learn how to

determine the future equivalent of money at a specific rate. In this case, the estimate of \$10,000,000 after 8 years (from 2006 to 2014) at an inflation rate of 4% is equivalent to \$13,686,000.

The 2014 equivalent cost of \$13.686 million is significantly less than the out-of-pocket loss of \$35 million. The conclusion is that the company should have spent \$10 million in 2006. Besides, there may be future breaches that the installed system will detect and eliminate.

This is an extremely simple analysis; yet, it demonstrates that at a very elementary level, it is possible to determine whether an expenditure at one point in time is economically worthwhile at some time in the future. In this situation, we validated that a previous expenditure (malware detection system) should have been made to overcome an unexpected expenditure (cost of the data breach) at a current time, 2014 here.

1.2 Performing an Engineering Economy Study ●●●

An engineering economy study involves many elements: problem identification, definition of the objective, cash flow estimation, financial analysis, and decision making. Implementing a structured procedure is the best approach to select the best solution to the problem.

The steps in an engineering economy study are as follows:

1. Identify and understand the problem; identify the objective of the project.
2. Collect relevant, available data and define viable solution alternatives.
3. Make realistic cash flow estimates.
4. Identify an economic measure of worth criterion for decision making.
5. Evaluate each alternative; consider noneconomic factors; use sensitivity analysis as needed.
6. Select the best alternative.
7. Implement the solution and monitor the results.

Technically, the last step is not part of the economy study, but it is, of course, a step needed to meet the project objective. There may be occasions when the best economic alternative requires more capital funds than are available, or significant noneconomic factors preclude the most economic alternative from being chosen. Accordingly, steps 5 and 6 may result in selection of an alternative different from the economically best one. Also, sometimes more than one project may be selected and implemented. This occurs when projects are independent of one another. In this case, steps 5 through 7 vary from those above. Figure 1–1 illustrates the steps above for one alternative. Descriptions of several of the elements in the steps are important to understand.

Problem Description and Objective Statement A succinct statement of the problem and primary objective(s) is very important to the formation of an alternative solution. As an illustration, assume the problem is that a coal-fueled power plant must be shut down by 2025 due to the production of excessive sulfur dioxide. The objectives may be to generate the forecasted electricity needed for 2025 and beyond, plus to not exceed all the projected emission allowances in these future years.

Alternatives These are stand-alone descriptions of viable solutions to problems that can meet the objectives. Words, pictures, graphs, equipment and service descriptions, simulations, etc. define each alternative. The best estimates for parameters are also part of the alternative. Some parameters include equipment first cost, expected life, salvage value (estimated trade-in, resale, or market value), and annual operating cost (AOC), which can also be termed maintenance and operating (M&O) cost, and subcontract cost for specific services. If changes in income (revenue) may occur, this parameter must be estimated.

Detailing all viable alternatives at this stage is crucial. For example, if two alternatives are described and analyzed, one will likely be selected and implementation initiated. If a third, more attractive method that was available is later recognized, a wrong decision was made.

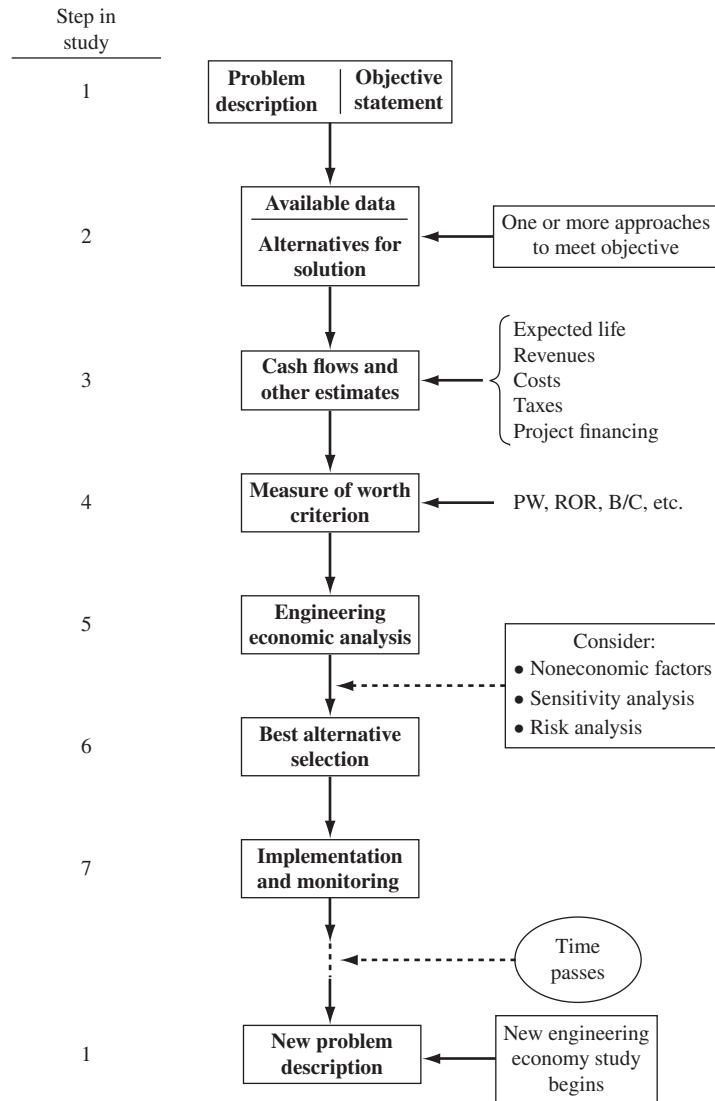

Figure 1–1
Steps in an engineering economy study.

Cash Flows All cash flows are estimated for each alternative. Since these are future expenditures and revenues, the results of step 3 usually prove to be inaccurate when an alternative is actually in place and operating. When cash flow estimates for specific parameters are expected to vary significantly from a *point estimate* made now, risk and sensitivity analyses (step 5) are needed to improve the chances of selecting the best alternative. Sizable variation is usually expected in estimates of revenues, AOC, salvage values, and subcontractor costs. Estimation of costs is discussed in Chapter 15, and the elements of variation (risk) and sensitivity analysis are included throughout the text.

Engineering Economy Analysis The techniques and computations that you will learn and use throughout this text utilize the cash flow estimates, time value of money, and a selected measure of worth. The result of the analysis will be one or more numerical values; this can be in one of several terms, such as money, an interest rate, number of years, or a probability. In the end, a specific measure of worth mentioned in the previous section will be used to select the best alternative.

Before an economic analysis technique is applied to the cash flows, some decisions about what to include in the analysis must be made. Two important possibilities are taxes and inflation. Federal, state or provincial, county, and city taxes will impact the costs of every alternative. An after-tax

analysis includes some additional estimates and methods compared to a before-tax analysis. If taxes and inflation are expected to impact all alternatives equally, they may be disregarded in the analysis. However, if the size of these projected costs is important, taxes and inflation should be considered. Also, if the impact of inflation over time is important to the decision, an additional set of computations must be added to the analysis; Chapter 14 covers the details.

Selection of the Best Alternative The measure of worth is a primary basis for selecting the best economic alternative. For example, if alternative A has a rate of return (ROR) of 15.2% per year and alternative B will result in an ROR of 16.9% per year, B is better economically. However, there can always be **noneconomic** or **intangible factors** that must be considered and that may alter the decision. There are many possible noneconomic factors; some typical ones are:

- Market pressures, such as need for an increased international presence
- Availability of certain resources, e.g., skilled labor force, water, power, tax incentives
- Government laws that dictate safety, environmental, legal, or other aspects
- Corporate management's or the board of director's interest in a particular alternative
- Goodwill offered by an alternative toward a group, for example, employees, union, county, etc.

As indicated in Figure 1–1, once all the economic, noneconomic, and risk factors have been evaluated, a final decision of the “best” alternative is made.

At times, only one viable alternative is identified. In this case, the **do-nothing (DN) alternative** must be included in the evaluation and may be chosen provided the measure of worth and other factors result in the alternative being a poor choice. The do-nothing alternative maintains the status quo.

Whether we are aware of it or not, we use criteria every day to choose between alternatives. For example, when you drive to campus or work, you decide to take the “best” route. But how did you define *best*? Was the best route the safest, shortest, fastest, cheapest, most scenic, or what? Obviously, depending upon which criterion or combination of criteria is used to identify the best, a different route might be selected each time. In economic analysis, **financial units (dollars or other currency)** are generally used as the tangible basis for evaluation. Thus, when there are several ways of accomplishing a stated objective, the alternative with the lowest overall cost or highest overall net income is selected.

1.3 Professional Ethics and Economic Decisions ●●●

Many of the fundamentals of engineering ethics are intertwined with the roles of money and economic-based decisions in the making of professionally ethical judgments. Some of these integral connections are discussed here, plus sections in later chapters discuss additional aspects of ethics and economics. For example, Chapter 9, Benefit/Cost Analysis and Public Sector Economics, includes material on the ethics of public project contracts and public policy. Although it is very limited in scope and space, it is anticipated that this coverage of the important role of economics in engineering ethics will prompt further interest on the part of students and instructors of engineering economy.

The terms **morals** and **ethics** are commonly used interchangeably, yet they have slightly different interpretations. Morals usually relate to the underlying tenets that form the character and conduct of a person in judging right and wrong. Ethical practices can be evaluated by using a code of morals or **code of ethics** that forms the standards to guide decisions and actions of individuals and organizations in a profession, for example, electrical, chemical, mechanical, industrial, or civil engineering. There are several different levels and types of morals and ethics.

Universal or common morals These are fundamental moral beliefs held by virtually all people. Most people agree that to steal, murder, lie, or physically harm someone is wrong.

It is possible for **actions** and **intentions** to come into conflict concerning a common moral. Consider the World Trade Center buildings in New York City. After their collapse on September 11, 2001, it was apparent that the design was not sufficient to withstand the heat generated by the firestorm caused by the impact of an aircraft. The structural engineers who worked on the design

surely did not have the intent to harm or kill occupants in the buildings. However, their design actions did not foresee this outcome as a measurable possibility. Did they violate the common moral belief of not doing harm to others or murdering?

Individual or personal morals These are the moral beliefs that a person has and maintains over time. These usually parallel the common morals in that stealing, lying, murdering, etc. are immoral acts.

It is quite possible that an individual strongly supports the common morals and has excellent personal morals, but these may conflict from time to time when decisions must be made. Consider the engineering student who genuinely believes that cheating is wrong. If he or she does not know how to work some test problems, but must make a certain minimum grade on the final exam to graduate, the decision to cheat or not on the final exam is an exercise in following or violating a personal moral.

Professional or engineering ethics Professionals in a specific discipline are guided in their decision making and performance of work activities by a formal standard or code. The code states the commonly accepted standards of honesty and integrity that each individual is expected to demonstrate in her or his practice. There are codes of ethics for medical doctors, attorneys, and, of course, engineers.

Although each engineering profession has its own code of ethics, the **Code of Ethics for Engineers** published by the National Society of Professional Engineers (NSPE) is very commonly used and quoted. This code, reprinted in its entirety in Appendix C, includes numerous sections that have direct or indirect economic and financial impact upon the designs, actions, and decisions that engineers make in their professional dealings. Here are three examples from the Code:

“Engineers, in the fulfillment of their duties, shall hold paramount the *safety, health, and welfare of the public.*” (section I.1)

“Engineers shall *not accept financial or other considerations*, including free engineering designs, from material or equipment suppliers for specifying their product.” (section III.5.a)

“Engineers using designs supplied by a client recognize that the *designs remain the property of the client* and may not be duplicated by the engineer for others without express permission.” (section III.9.b)

As with common and personal morals, conflicts can easily rise in the mind of an engineer between his or her own ethics and that of the employing corporation. Consider a manufacturing engineer who has recently come to firmly disagree morally with war and its negative effects on human beings. Suppose the engineer has worked for years in a military defense contractor’s facility and does the detailed cost estimations and economic evaluations of producing fighter jets for the Air Force. The Code of Ethics for Engineers is silent on the ethics of producing and using war materiel. Although the employer and the engineer are not violating any ethics code, the engineer, as an individual, is stressed in this position. Like many people during a declining national economy, retention of this job is of paramount importance to the family and the engineer. Conflicts such as this can place individuals in real dilemmas with no or mostly unsatisfactory alternatives.

At first thought, it may not be apparent how activities related to engineering economics may present an ethical challenge to an individual, a company, or a public servant in government service. Many money-related situations, such as those that follow, can have ethical dimensions.

In the design stage:

- Safety factors are compromised to ensure that a price bid comes in as low as possible.
- Family or personal connections with individuals in a company offer unfair or insider information that allows costs to be cut in strategic areas of a project.
- A potential vendor offers specifications for company-specific equipment, and the design engineer does not have sufficient time to determine if this equipment will meet the needs of the project being designed and costed.

During the construction or implementation phase:

- Price materials and equipment from a high-quality, reputable vendor, but actually purchase the items from an inferior, cheaper supplier.

- Construct with below-standard or sub-code materials when detection is difficult. (For example, in locations where water is sourced from desalination, use mixing water that is not completely desalinated for structural concrete, which will accelerate corrosion of imbedded steel.)

While the system is operating:

- Delayed or below-standard maintenance can be performed to save money when cost overruns exist in other segments of a project.
- Opportunities to purchase cheaper repair parts can save money for a subcontractor working on a fixed-price contract.
- Safety margins are compromised because of cost, personal inconvenience to workers, tight time schedules, etc.

A good example of the last item—safety is compromised while operating the system—is the situation that arose in 1984 in Bhopal, India (Martin and Schinzinger 2005, pp. 245–8). A Union Carbide plant manufacturing the highly toxic pesticide chemical methyl isocyanate (MIC) experienced a large gas leak from high-pressure tanks. Some 500,000 persons were exposed to inhalation of this deadly gas that burns moist parts of the body. There were 2500 to 3000 deaths within days, and over the following 10-year period, some 12,000 death claims and 870,000 personal injury claims were recorded. Although Union Carbide owned the facility, the Indian government had only Indian workers in the plant. Safety practices clearly eroded due to cost-cutting measures, insufficient repair parts, and reduction in personnel to save salary money. However, one of the surprising practices that caused unnecessary harm to workers was the fact that masks, gloves, and other protective gear were not worn by workers in close proximity to the tanks containing MIC. Why? Unlike plants in the United States and other countries, there was no air conditioning in the Indian plant, resulting in high ambient temperatures in the facility.

Many ethical questions arise when corporations operate in international settings where the corporate rules, worker incentives, cultural practices, and costs in the home country differ from those in the host country. Often these ethical dilemmas are fundamentally based in the economics that provide cheaper labor, reduced raw material costs, less government oversight, and a host of other cost-reducing factors. When an engineering economy study is performed, it is important for the engineer performing the study to consider all ethically related matters to ensure that the cost and revenue estimates reflect what is likely to happen once the project or system is operating.

It is important to understand that the translation from universal morals to personal morals and professional ethics does vary from one culture and country to another. As an example, consider the common belief (universal moral) that the awarding of contracts and financial arrangements for services to be performed (for government or business) should be accomplished in a fair and transparent fashion. In some societies and cultures, corruption in the process of contract making is common and often “overlooked” by the local authorities, who may also be involved in the affairs. Are these immoral or unethical practices? Most would say, “Yes, this should not be allowed. Find and punish the individuals involved.” Yet, such practices do continue, thus indicating the differences in interpretation of common morals as they are translated into the ethics of individuals and professionals.

EXAMPLE 1.2

Jamie is an engineer employed by Burriss, a United States–based company that develops subway and surface transportation systems for medium-sized municipalities in the United States and Canada. He has been a registered professional engineer (PE) for the last 15 years. Last year, Carol, an engineer friend from university days who works as an individual consultant, asked Jamie to help her with some cost estimates on a metro train job. Carol offered to pay for his time and talent, but Jamie saw no reason to take money for helping with data commonly used by him in performing his job at Burriss. The estimates took one weekend to complete, and once Jamie delivered them to Carol, he did not hear from her again; nor did he learn the identity of the company for which Carol was preparing the estimates.

Yesterday, Jamie was called into his supervisor’s office and told that Burriss had not received the contract award in Sharpstown, where a metro system is to be installed. The project estimates were prepared by Jamie and others at Burriss over the past several months. This job was greatly needed by Burriss, as the country and most municipalities were in a real economic

slump, so much so that Burris was considering furloughing several engineers if the Sharpstown bid was not accepted. Jamie was told he was to be laid off immediately, not because the bid was rejected, but because he had been secretly working without management approval for a prime consultant of Burris' main competitor. Jamie was astounded and angry. He knew he had done nothing to warrant firing, but the evidence was clearly there. The numbers used by the competitor to win the Sharpstown award were the same numbers that Jamie had prepared for Burris on this bid, and they closely matched the values that he gave Carol when he helped her.

Jamie was told he was fortunate, because Burris' president had decided to not legally charge Jamie with unethical behavior and to not request that his PE license be rescinded. As a result, Jamie was escorted out of his office and the building within one hour and told to not ask anyone at Burris for a reference letter if he attempted to get another engineering job.

Discuss the ethical dimensions of this situation for Jamie, Carol, and Burris' management. Refer to the NSPE Code of Ethics for Engineers (Appendix C) for specific points of concern.

Solution

There are several obvious errors and omissions present in the actions of Jamie, Carol, and Burris' management in this situation. Some of these mistakes, oversights, and possible code violations are summarized here.

Jamie

- Did not learn identity of company Carol was working for and whether the company was to be a bidder on the Sharpstown project
- Helped a friend with confidential data, probably innocently, without the knowledge or approval of his employer
- Assisted a competitor, probably unknowingly, without the knowledge or approval of his employer
- Likely violated, at least, Code of Ethics for Engineers section II.1.c, which reads, "Engineers shall not reveal facts, data, or information without the prior consent of the client or employer except as authorized or required by law or this Code."

Carol

- Did not share the intended use of Jamie's work
- Did not seek information from Jamie concerning his employer's intention to bid on the same project as her client
- Misled Jamie in that she did not seek approval from Jamie to use and quote his information and assistance
- Did not inform her client that portions of her work originated from a source employed by a possible bid competitor
- Likely violated, at least, Code of Ethics for Engineers section III.9.a, which reads, "Engineers shall, whenever possible, name the person or persons who may be individually responsible for designs, inventions, writings, or other accomplishments."

Burris' management

- Acted too fast in dismissing Jamie; they should have listened to Jamie and conducted an investigation
- Did not put him on administrative leave during a review
- Possibly did not take Jamie's previous good work record into account

These are not all ethical considerations; some are just plain good business practices for Jamie, Carol, and Burris.

1.4 Interest Rate and Rate of Return ●●●

Interest is the manifestation of the time value of money. Computationally, interest is the difference between an ending amount of money and the beginning amount. If the difference is zero or negative, there is no interest. There are always two perspectives to an amount of interest—interest paid and interest earned. These are illustrated in Figure 1–2. Interest is **paid** when a person or organization

**Figure 1–2**

(a) Interest paid over time to lender. (b) Interest earned over time by investor.

borrowed money (obtained a loan) and repays a larger amount over time. Interest is **earned** when a person or organization saved, invested, or lent money and obtains a return of a larger amount over time. The numerical values and formulas used are the same for both perspectives, but the interpretations are different.

Interest paid on borrowed funds (a loan) is determined using the original amount, also called the *principal*,

$$\text{Interest} = \text{amount owed now} - \text{principal} \quad [1.1]$$

When interest paid over a *specific time unit* is expressed as a percentage of the principal, the result is called the **interest rate**.

$$\text{Interest rate (\%)} = \frac{\text{interest accrued per time unit}}{\text{principal}} \times 100\% \quad [1.2]$$

The time unit of the rate is called the **interest period**. By far the most common interest period used to state an interest rate is 1 year. Shorter time periods can be used, such as 1% per month. Thus, the interest period of the interest rate should always be included. If only the rate is stated, for example, 8.5%, a 1-year interest period is assumed.

EXAMPLE 1.3

An employee at LaserKinetics.com borrows \$10,000 on May 1 and must repay a total of \$10,700 exactly 1 year later. Determine the interest amount and the interest rate paid.

Solution

The perspective here is that of the borrower since \$10,700 repays a loan. Apply Equation [1.1] to determine the interest paid.

$$\text{Interest paid} = \$10,700 - 10,000 = \$700$$

Equation [1.2] determines the interest rate paid for 1 year.

$$\text{Percent interest rate} = \frac{\$700}{\$10,000} \times 100\% = 7\% \text{ per year}$$

EXAMPLE 1.4

Stereophonics, Inc. plans to borrow \$20,000 from a bank for 1 year at 9% interest for new recording equipment. (a) Compute the interest and the total amount due after 1 year. (b) Construct a column graph that shows the original loan amount and total amount due after 1 year used to compute the loan interest rate of 9% per year.

Solution

(a) Compute the total interest accrued by solving Equation [1.2] for interest accrued.

$$\text{Interest} = \$20,000(0.09) = \$1800$$
