Brief Contents

Preface xii

Part 1: Overview of Managerial Economics 1

1. Nature and Scope of Managerial Economics 3
2. Economic Optimization 25
3. Demand and Supply 81

Part 2: Demand Analysis and Estimation 111

4. Demand Analysis 113
5. Demand Estimation 161
6. Forecasting 197

Part 3: Production and Competitive Markets 239

7. Production Analysis 241
8. Cost Analysis and Estimation 289
9. Linear Programming 329
10. Competitive Markets 369
11. Performance and Strategy in Competitive Markets 403

Part 4: Imperfect Competition 445

12. Monopoly and Monopsony 447
13. Monopolistic Competition and Oligopoly 487
14. Game Theory and Competitive Strategy 529
15. Pricing Practices 565

Part 5: Long-Term Investment Decisions 609

16. Risk Analysis 611
17. Capital Budgeting 649
18. Organization Structure and Corporate Governance 685
19. Government in the Market Economy 719

Appendix A: Compounding and the Time Value of Money 757

Appendix B: Interest Factor Tables 773

Part 1: Overview of Managerial Economics

1

Chapter 1: Nature and Scope of Managerial Economics	3	Summary	45
How is Managerial Economics Useful?	3	Questions	46
Managerial Application 1.1 Business Ethics	5	Self-Test Problems and Solutions	47
Theory of the Firm	7	Problems	52
Profit Measurement	11	Case Study: Spreadsheet Analysis of the EOQ at the Neighborhood Pharmacy, Inc.	56
Managerial Application 1.2 The World is Turning to Capitalism and Democracy	13	Selected References	57
Why do Profits Vary Among Firms?	14	Appendix 2A: Maths Analysis for Managers	58
Managerial Application 1.3 Google on Social Responsibility	15	Properties of Real Numbers	58
Role of Business in Society	16	Equations	60
Managerial Application 1.4 The IKEA way	18	Concept of a Marginal	63
Structure of this Text	18	Rules for Differentiating a Function	65
Summary	20	Appendix 2B: Multivariate Optimization and the Lagrangian Technique	72
Questions	20	Partial Derivative Concept	72
Case Study: Is Coca-Cola the 'Perfect' Business?	21	Maximizing Multivariate Functions	73
Selected References	24	Constrained Optimization	74
Chapter 2: Economic Optimization	25	Problem	80
Economic Optimization Process	25	Chapter 3: Demand and Supply	81
Revenue Relations	27	Basis for Demand	81
Managerial Application 2.1 Ethical Aspects of Corporate Governance	28	Managerial Application 3.1 Energy Consumption in the World	83
Managerial Application 2.2 Do Firms Really Optimize?	33	Market Demand Function	83
Cost Relations	34	Demand Curve	85
Profit Relations	38	Basis for Supply	88
Incremental Concept in Economic Analysis	42	Market Supply Function	89
Managerial Application 2.3 Behavioural Economics	43	Supply Curve	91
		Market Equilibrium	94
		Summary	100

Questions	101	Case Study: Spreadsheet Analysis of Demand and Supply for Sunbest Orange Juice	108
Self-Test Problems and Solutions	101		
Problems	104	Selected References	110

Part 2: Demand Analysis and Estimation

111

Chapter 4: Demand Analysis	113		
Consumer Decision-Making	113	Managerial Application 5.2 Market Experiments on the Web	172
Managerial Application 4.1 Odd-Number Pricing Riddle	119	Measures of Regression Model Significance	177
Indifference Curves	119	Judging Variable Significance	182
Budget Constraints	121	Summary	184
Individual Demand	125	Questions	185
Optimal Consumption	131	Self-Test Problems and Solutions	185
Managerial Application 4.2 Relationship Marketing	132	Problems	190
Demand Sensitivity Analysis: Elasticity	135	Case Study: Demand Estimation for Mrs. Smyth's Pies	194
Price Elasticity of Demand	136	Selected Reference	196
Price Elasticity and Marginal Revenue	140	Chapter 6: Forecasting	197
Managerial Application 4.3 Haggling in the Car Business	144	Forecasting Applications	197
Price Elasticity and Optimal Pricing Policy	144	Managerial Application 6.1 Economic Forecasting: The Art and the Science	199
Cross-Price Elasticity of Demand	146	Qualitative Analysis	200
Income Elasticity of Demand	147	Trend Analysis and Projection	201
Managerial Application 4.4 What's in a Name?	149	Managerial Application 6.2 Crypto Predictions	206
Summary	149	Business Cycle	206
Questions	150	Managerial Application 6.3 The Stock Market and the Business Cycle	213
Self-Test Problems and Solutions	151	Exponential Smoothing	214
Problems	156	Econometric Forecasting	217
Case Study: Optimal Level of Advertising	159	Managerial Application 6.4 How Good is Your Forecasting Ability?	218
Selected References	160	Judging Forecast Reliability	221
Chapter 5: Demand Estimation	161	Choosing the Best Forecast Technique	223
Interview and Experimental Methods	161	Summary	225
Simple Demand Curve Estimation	162	Questions	226
Managerial Application 5.1 Sampling Technology for TV Advertising	163	Self-Test Problems and Solutions	227
Simple Market Demand Curve Estimation	165	Problems	231
Identification Problem	168	Case Study: Forecasting Global Performance for a Mickey Mouse Organization	235
Regression Analysis	172	Selected Reference	238

Part 3: Production and Competitive Markets

239

Chapter 7: Production Analysis	241		
Factors of Production	241	Managerial Application 8.2 GAAP and IRFS	296
The Short Run	242	Managerial Application 8.3 Cost Stickiness	300
The Long Run	242	Minimum Efficient Scale	301
Production Functions	242	Firm Size and Plant Size	302
Input–Output Analysis	242	Learning Curves	308
Total, Marginal, and Average Product	244	Managerial Application 8.4 Bigger Isn't Always Better	308
Law of Marginal Returns to a Factor	251	Economies of Scope	311
Law of Diminishing Returns to a Factor	251	Cost–Volume–Profit Analysis	312
Managerial Application 7.1 Efficiency Wages	252	Summary	317
Input Combination Choice	255	Questions	318
Marginal Revenue Product and Optimal Employment	259	Self-Test Problems and Solutions	318
Managerial Application 7.2 National Minimum Wages in the EU	260	Problems	321
Optimal Combination of Multiple Inputs	262	Case Study: Estimating Hospitalization Costs for Regional Hospitals	324
Optimal Levels of Multiple Inputs	266	Selected References	327
Returns to Scale	267	Chapter 9: Linear Programming	329
Productivity Measurement	269	Basic Assumptions	329
Managerial Application 7.3 Labour Productivity Growth in Selected Countries 2009–2016	270	Managerial Application 9.1 Karmarkar's LP Breakthrough	330
Summary	271	Managerial Application 9.2 LP: More than a Visual Approach	331
Questions	272	Production Planning for Multiple Products	331
Self-Test Problems and Solutions	273	Graphic Specification and Solution	333
Problems	276	Algebraic Specification and Solution	338
Case Study: Worker Productivity Among Giant US Corporations	280	Managerial Application 9.3 LP on the PC!	342
Selected References	283	Dual in Linear Programming	342
Appendix 7A: A Constrained Optimization Approach to Developing the Optimal Input Combination Relationships	284	Dual Specification	343
Constrained Production Maximization	284	Solving the Dual Problem	345
Constrained Cost Minimization	286	Summary	348
Problem	287	Questions	349
Chapter 8: Cost Analysis and Estimation	289	Self-Test Problems and Solutions	349
Economic and Accounting Costs	289	Problems	357
Role of Time in Cost Analysis	291	Case Study: An LP Pension Funding Model	362
Managerial Application 8.1 GE's '20-70-10' Plan	292	Appendix 9A: Rules for Forming the Dual Linear Programming Problem	365
Short-Run Cost Curves	293	Primal Problem	365
Long-Run Cost Curves	296	Dual Problem	366
		Selected References	367

Chapter 10: Competitive Markets	369	Competitive Market Efficiency	403
Competitive Environment	369	Managerial Application 11.1 The Walmart Phenomenon	407
Factors that Shape the Competitive Environment	370	Market Failure	408
Managerial Application 10.1 International Trade Benefits the Rich More Than the Poor	371	Role for Government	410
Competitive Market Characteristics	373	Subsidy and Tax Policy	411
Managerial Application 10.2 Is the Stock Market Perfectly Competitive?	374	Managerial Application 11.2 Corn Growers Discover Oil!	411
Profit Maximization in Competitive Markets	375	Tax Incidence and Burden	414
Marginal Cost and Firm Supply	379	Managerial Application 11.3 Measuring Economic Profits	418
Competitive Market Supply Curve	382	Price Controls	418
Managerial Application 10.3 Dot.com	383	Business Profit Rates	421
Competitive Market Equilibrium	386	Market Structure and Profit Rates	424
Summary	388	Competitive Market Strategy	426
Questions	389	Long-Run Firm Performance	427
Self-Test Problems and Solutions	390	Summary	427
Problems	395	Questions	429
Case Study: Profitability Effects of Firm Size for DJIA Companies	399	Self-Test Problems and Solutions	430
Selected References	401	Problems	436
Chapter 11: Performance and Strategy in Competitive Markets	403	Case Study: The Most Profitable S&P 500 Companies	441
		Selected References	444

Part 4: Imperfect Competition

445

Chapter 12: Monopoly and Monopsony	447	Questions	471
Monopoly Market Characteristics	447	Self-Test Problems and Solutions	471
Managerial Application 12.1 Commission Fines Eight Producers of Capacitors €254 Million for Participating in Cartel	449	Problems	478
Profit Maximization Under Monopoly	450	Case Study: Effect of R&D on Tobin's q	483
Social Costs of Monopoly	453	Selected References	485
Social Benefits of Monopoly	457	Chapter 13: Monopolistic Competition and Oligopoly	487
Monopoly Regulation	459	Contrast Between Monopolistic Competition and Oligopoly	487
Managerial Application 12.2 Is Ticketmaster a Monopoly?	461	Monopolistic Competition	489
Monopsony	464	Managerial Application 13.1 Dell's Price War with Dell	490
Antitrust Policy	468	Monopolistic Competition Process	493
Managerial Application 12.3 Is This Why They Call it 'Hardball'?	468	Managerial Application 13.2 Intel: Running Fast to Stay in Place	493
Competitive Strategy in Monopoly Markets	469	Oligopoly	497
Summary	470	Cartels and Collusion	498

Oligopoly Output-Setting Models	499	Self-Test Problems and Solutions	554
Oligopoly Price-Setting Models	504	Problems	557
Census Measures of Market Concentration	511	Case Study: Time Warner, Inc. is Playing Games with Stockholders	561
Managerial Application 13.3 Horizontal Merger Guidelines	513	Selected References	563
Summary	514	Chapter 15: Pricing Practices	565
Questions	515	Pricing Rules and Analysis	566
Self-Test Problems and Solutions	516	Mark-Up Pricing and Profit Maximization	567
Problem	520	Managerial Application 15.1 Mark-Up Pricing Technology	568
Case Study: Market Structure Analysis at Columbia Drugstores, Inc.	525	Price Discrimination	571
Selected References	527	Price Discrimination Example	573
Chapter 14: Game Theory and Competitive Strategy	529	Managerial Application 15.2 Do Colleges Price Discriminate?	573
Game Theory Basics	529	Two-Part Pricing	577
Managerial Application 14.1 Asymmetric Information	531	Multiple-Product Pricing	580
Prisoner's Dilemma	532	Joint Products	582
Nash Equilibrium	535	Joint Product Pricing Example	584
Infinitely Repeated Games	537	Managerial Application 15.3 10 cents for a Gallon of Gas in Dayton, Ohio	585
Managerial Application 14.2 The Market for Lemons	538	Managerial Application 15.4 Why Some Price Wars Never End	589
Finitely Repeated Games	539	Summary	589
Game Theory and Auction Strategy	541	Questions and Answers	590
Managerial Application 14.3 Wrigley's Success Formula	542	Self-Test Problems and Solutions	591
Competitive Strategy	543	Problems	593
Pricing Strategies	545	Case Study: Pricing Practices in the Denver, Colorado, Newspaper Market	597
Managerial Application 14.4 Network Switching Costs	547	Selected References	599
Nonprice Competition	548	Appendix 15A: Transfer Pricing	600
Summary	552	Transfer Pricing Problem	600
Questions	553	Global Transfer Pricing Example	602
		Problem	606

Part 5: Long-Term Investment Decisions

609

Chapter 16: Risk Analysis	611	Managerial Application 16.2 Why are Lotteries Popular?	621
Concepts of Risk and Uncertainty	611	Adjusting the Valuation Model for Risk	623
Probability Concepts	613	Managerial Application 16.3 Stock Option Backdating Scandal	624
Managerial Application 16.1 Behavioural Finance	613	Decision Trees and Computer Simulation	628
Standard Normal Concept	619	Managerial Application 16.4 Internet Fraud	633
Utility Theory and Risk Analysis	621		

Summary	634	Managerial Application 18.3 Institutional Investors are Corporate Activists	703
Questions	635	Agreements and Alliances Among Firms	703
Self-Test Problems and Solutions	636	Legal and Ethical Environment	705
Problems	639	Managerial Application 18.4 Sarbanes–Oxley	706
Case Study: Stock-Price Beta Estimation for Google, Inc.	644	Summary	707
Selected References	647	Questions	709
Chapter 17: Capital Budgeting	649	Self-Test Problems and Solutions	709
Capital Budgeting Process	649	Problems	711
Steps in Capital Budgeting	650	Case Study: Do Boards of Directors Make Good Corporate Watchdogs?	714
Managerial Application 17.1 Market-Based Capital Budgeting	652	Selected References	717
Cash Flow Estimation Example	652	Chapter 19: Government in the Market Economy	719
Capital Budgeting Decision Rules	655	Externalities	719
Project Selection	660	Managerial Application 19.1 ‘Tobacco’ Ethics	722
Managerial Application 17.2 Is the Sun Setting on Japan’s Vaunted MOF?	661	Solving Externalities	722
Cost of Capital	665	Public Goods	724
Managerial Application 17.3 Federal Government Support for R&D	666	Managerial Application 19.2 Political Corruption	727
Managerial Application 17.4 Capital Allocation at Berkshire Hathaway, Inc.	670	Optimal Allocation of Social Resources	727
Optimal Capital Budget	671	Benefit–Cost Methodology	730
Summary	673	Benefit–Cost Criteria	732
Questions	674	Additional Methods of Improving Public Management	736
Self-Test Problems and Solutions	675	Regulatory Reform in the New Millennium	738
Problems	678	Health Care Reform	740
Selected References	683	Managerial Application 19.3 Price Controls for Pharmaceutical Drugs	741
Chapter 18: Organization Structure and Corporate Governance	685	Summary	743
Organization Structure	685	Questions	744
Transaction Cost Theory of the Firm	687	Self-Test Problems and Solutions	745
The Firm’s Agency Problem	688	Problems	751
Managerial Application 18.1 Organization Design at GE	689	Selected References	755
Organization Design	692	Appendix A: Compounding and the Time Value of Money	757
Decision Management and Control	694	Appendix B: Interest Factor Tables	773
Corporate Governance	696	Appendix C: Statistical Tables	781
Managerial Application 18.2 Company Information on the Internet	698	Index	787
Ownership Structure as a Corporate Governance Mechanism	699		

About the Authors

Eric Bentzen (Copenhagen Business School) is Associate Professor at Copenhagen Business School, where he teaches undergraduate and graduate courses in Managerial Economics and Business Analytics. He is a member of several professional organizations. He has published in *Applied Financial Economics*, *European Journal of Finance*, *Management Decision*, *Financial Markets and Portfolio Management*, and other leading academic journals.

Carsten Scheibye (Copenhagen Business School) is Assistant Professor at Copenhagen Business School, where he teaches undergraduate courses in Managerial Economics. He has significant experience in course coordination and management as well as within didactical and pedagogical development of the learning environment surrounding the field of Managerial Economics. In addition, he has received educational prizes for his teaching abilities. Among these are the Education Prize from the Danish Society of Business and Education.

The late **Mark Hirschey** (University of Wisconsin-Madison) was the Anderson W. Chandler Professor of Business at the University of Kansas, where he was teaching undergraduate and graduate courses in managerial economics and finance. Professor Hirschey was president of the Association of Financial Economists and a member of several professional organizations. He has published articles in the *American Economic Review*, *Review of Economics and Statistics*, *Journal of Business*, *Journal of Business and Economic Statistics*, *Journal of Finance*, *Journal of Financial Economics*, *Journal of Industrial Economics*, and other leading academic journals. He was editor of *Advances in Financial Economics*, and past editor of *Managerial and Decision Economics*.

Preface

Economic concepts show how to apply common sense to understand business and solve managerial problems. Economic intuition is really useful. It helps managers decide on which products to produce, costs to consider, and prices to charge. It also helps them decide on the best hiring policy and the most effective style of organization. Students and future managers need to learn these things. The topics covered in managerial economics are powerful tools that can be used to make managers more effective and their careers more satisfying. By studying managerial economics, those seeking to further their business careers learn how to more effectively collect, organize and analyze information.

A key feature of this book is its depiction of the firm as a cohesive organization. Effective management involves an integration of the accounting, finance, marketing, personnel, and production functions. This integrative approach demonstrates that important managerial decisions are *interdisciplinary* in the truest sense of the word.

Although both microeconomic and macroeconomic relations have implications for managerial decision-making, this book concentrates on microeconomic topics. Following development of the economic model of the firm, the vital role of profits is examined. Because economic decision-making often requires an elementary understanding of optimization techniques and statistical relations, those basic concepts are described early in the text. Because demand for a firm's products plays a crucial role in determining its profitability and ongoing success, demand analysis and estimation is an essential area of study. An important part of this study is an investigation of the basic forces of demand and supply. This naturally leads to discussion of economic forecasting and methods for assessing forecast reliability. Production theory and cost analysis are then explored as means of understanding the economics of resource allocation and employment.

Once the internal workings of a successful firm are understood, attention can turn towards consideration of the firm's external economic environment. Market structure analysis provides the foundation for studying the external economic environment and for defining an effective competitive strategy. The role of government in the market economy, including the constraints it imposes on business, requires a careful examination of regulation and antitrust law. Risk analysis and capital budgeting are also shown as methods for introducing marginal analysis into the long-range strategic planning and control process. Finally, given government's increasing role in managing demand and supply for basic services, such as education and healthcare, the use of economic principles to understand and improve public management is also considered.

Managerial Economics, 15th Edition, takes a practical problem-solving approach. The focus is on the economics—not the mathematics—of the managerial decision process. Quantitative tools are sometimes employed, but the emphasis is on economic intuition.

THIS 15TH EDITION

Students and instructors will find that *Managerial Economics*, 15th Edition, provides an efficient calculus-based introduction and guide to the optimization process. Chapter 2, 'Economic Optimization', illustrates how the concept of a derivative can be used as a practical tool to understand and apply marginal analysis. 'Multivariate Optimization and the Lagrangian Technique', Appendix 2B, examines the optimization process for equations with three or more variables. Such techniques are especially helpful when managers face constrained optimization problems, or decision situations with limited alternatives. Throughout the text, a wide variety of problems describing real-world decisions can be solved using such techniques.

Managerial Economics, 15th Edition provides an intuitive guide to model building, analysis and basic economic relations. Although differential calculus is an obviously helpful tool for understanding the process of economic optimization, it is important that students not let mathematical manipulation get in the way of their basic grasp of economic concepts. Although those using a non-calculus-based approach can safely skip parts of Chapter 2 and Appendix 2B, all other material is fully and completely assessable. With practice using a wide variety of problems and examples throughout the text, all students are able to gain a simple, practical understanding of how economics can be used to understand and improve managerial decisions.

Learning Aids

- Each chapter incorporates a wide variety of simple numerical examples and detailed practical illustrations of chapter concepts. These features portray the valuable use and real-world implications of covered material.
- Each chapter includes short Managerial Applications boxes to show current examples of how the concepts introduced in managerial economics apply to real-world situations. New Managerial Applications based on articles from the Internet or *Barron's*, *Business Week*, *Forbes*, *Fortune*, and *The Wall Street Journal* are provided. This feature stimulates student interest and offers a popular basis for classroom discussion.
- The book incorporates several new regression-based illustrations of chapter concepts using actual company data, or hypothetical data adapted from real-world situations. Like all aspects of the text, this material is self-contained and intuitive.
- Effective managers must be sensitive to the special challenges posed by an increasingly global marketplace. To increase student awareness of such issues, a number of examples, Managerial Applications, and case studies that relate to global business topics are featured.
- Selected chapters are accompanied by a case study that provides in-depth treatment of chapter concepts. To meet the needs of all instructors and their students, these case studies are written to allow, but do not require, a computer-based approach. These case studies are fully self-contained and especially helpful to instructors who wish to more fully incorporate the use of basic spreadsheet and statistical software in their courses.
- New end-of-chapter questions and problems are provided, after having been subject to necessary revision and class testing. Questions are designed to give students the opportunity to grasp basic concepts on an intuitive level and express their understanding in a nonquantitative fashion. Problems cover a wide variety of decision situations and illustrate the role of economic analysis from within a simple numerical framework.

- Each chapter includes self-test problems with detailed solutions to show students how economic tools and techniques can be used to solve practical business problems. These self-test problems are a proven study aid that greatly enhances the learning value of end-of-chapter questions and problems.

Companion Website

Managerial Economics, 15th Edition is supported by a Companion Website to help make teaching and learning the material both easy and enjoyable.

Acknowledgments

We are indebted to staff at Cengage Learning for making the 15th edition a reality.

A number of people have aided in the preparation of *Managerial Economics*. Helpful suggestions and constructive comments have been received from a great number of instructors and students who have used previous editions. Numerous reviewers have also provided insights and assistance in clarifying difficult material. Among those who have been especially helpful in the development of previous editions are: Barry Keating, University of Notre Dame; Stephen Conroy, University of San Diego; Xu Wang, Texas A&M University; Michael Brandl, University of Texas, Austin; Neil Garston, California State University, Los Angeles; Albert Okunade, University of Memphis; David Carr, University of South Dakota; Steven Rock, Western Illinois University; Mel Borland, Western Kentucky University; Tom Staley, San Francisco State University.

Many thanks to the reviewers of this edition, Gu Guowei of London South Bank University, UK and Dr Tendeukayi Mugadza of Monash University, South Africa.

Every effort has been made to minimize errors in the book. However, errors do occasionally slip through despite diligent efforts to provide an error-free package of text and ancillary materials. Readers are invited to correspond with me directly concerning any corrections or other suggestions.

It is obvious that economic efficiency is an essential ingredient in the successful management of both business and public-sector organizations. Like any dynamic area of study, the field of managerial economics continues to undergo profound change in response to the challenges imposed by a rapidly evolving environment. It is exciting to participate in these developments. I sincerely hope that *Managerial Economics* contributes to a better understanding of the usefulness of economic theory.

Teaching & Learning Support Resources

Cengage's peer reviewed content for higher and further education courses is accompanied by a range of digital teaching and learning support resources. The resources are carefully tailored to the specific needs of the instructor, student and the course. Examples of the kind of resources provided include:

- A password protected area for instructors with, for example, a testbank, PowerPoint slides and an instructor's manual.
- An open-access area for students including, for example, useful weblinks and glossary terms.

Lecturers: to discover the dedicated lecturer digital support resources accompanying this textbook please register here for access: login.cengage.com.

Students: to discover the dedicated student digital support resources accompanying this textbook, please search for MANAGERIAL ECONOMICS on: cengagebrain.co.uk.

Nature and Scope of
Managerial Economics

CHAPTER 2
Economic Optimization

CHAPTER 3
Demand and Supply

P A R T

Nature and Scope of Managerial Economics

Bill Gates, founder of Microsoft Corporation, launched Microsoft together with Paul Allen back in 1975. Microsoft became the largest PC company in the world. From 1995 to 2017 Gates held the *Forbes* title as one of the richest persons in the world, with an estimated net worth of \$91.7 billion as of February 2018.

Bill Gates' success is powerful testimony to the practical usefulness of managerial economics. Managerial economics answers fundamental questions. When is the market for a product so attractive that entry or expansion becomes appealing? When is exit preferable to continued operation? Why do some professions pay well, while others offer only meagre pay? Successful managers make good decisions, and one of their most useful tools is the methodology of managerial economics.

HOW IS MANAGERIAL ECONOMICS USEFUL?

Economic theory and methodology lay down rules for improving business and public policy decisions.

Evaluating Choice Alternatives

managerial economics

Applies economic tools and techniques to business and administrative decision-making.

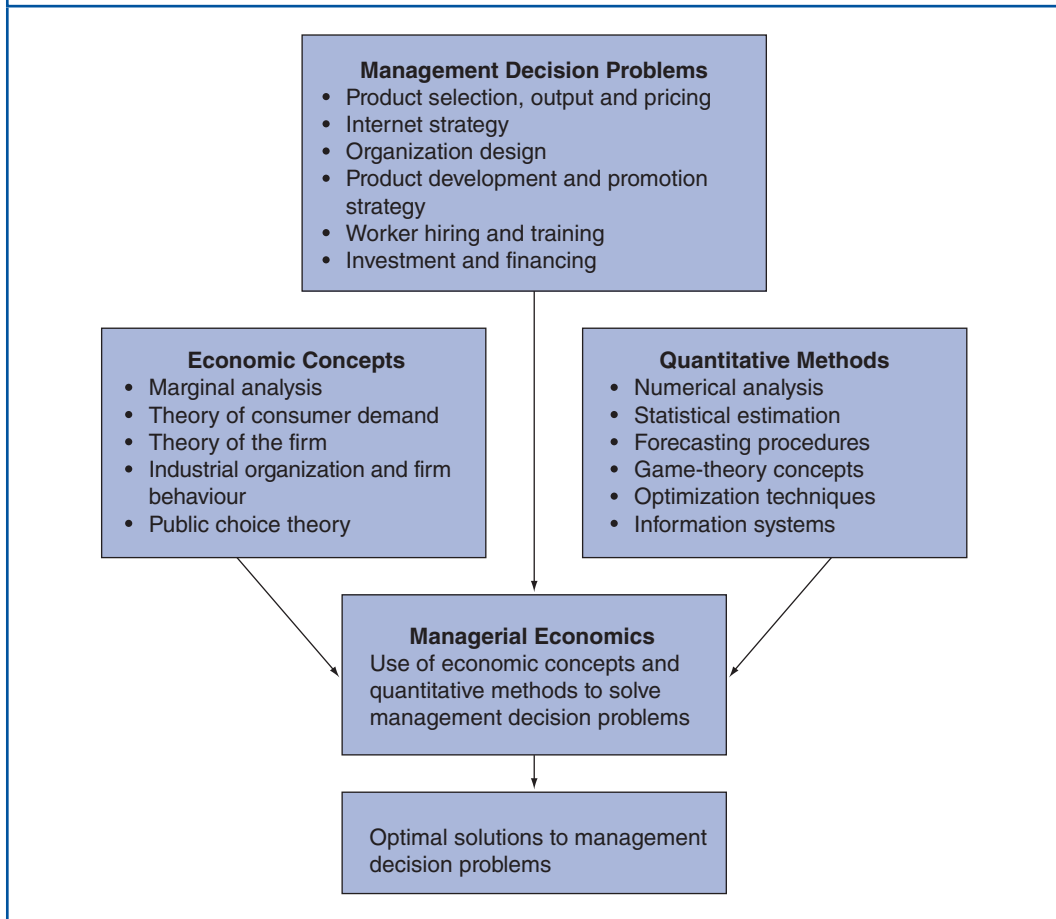

Managerial economics helps managers recognize how economic forces affect organizations and describes the economic consequences of managerial behaviour. It also links economic concepts, data and quantitative methods to develop vital tools for managerial decision-making. This process is illustrated in Figure 1.1.

Managerial economics identifies ways to achieve goals efficiently. For example, suppose a small business seeks rapid growth to reach a size that permits efficient use of national media advertising; managerial economics can be used to identify pricing and production strategies to help meet this short-run objective quickly and effectively. Similarly, managerial economics provides production and marketing rules that permit the company to maximize net profits once it has achieved growth or market-share objectives.

Managerial economics has applications in both profit and not-for-profit sectors. For example, an administrator of a nonprofit hospital strives to provide the best medical care possible given limited medical staff, equipment, and related resources. Using the tools and concepts of managerial economics, the administrator can determine the optimal allocation of these limited resources. In short, managerial economics helps managers arrive at a set of operating rules that aid in the efficient use of scarce human and capital resources. By following these rules, businesses, nonprofit organizations and government agencies are able to meet objectives efficiently.

Figure 1.1 Managerial Economics is a Tool for Improving Management Decision-Making

Managerial economics uses economic concepts and quantitative methods to solve managerial problems.

Managerial Decision-Making

Managerial decision-making problems very often have many impacts, some of them immediate, and others more modest. In order to make decisions we need information. Sometimes all the relevant information we need is readily available and we can effectively use this information in the decision-making process. In other settings, information may be available, but we cannot effectively use it because of limitations. Many decision problems are complicated due to uncertainty. When we have a decision problem with uncertain information we can use two different ways to reach a decision. One is to simulate different combinations of the outcome. Another is to use mathematical and statistical methods to calculate the expected value of the outcome. Even with maths and statistics there are many decision problems that are highly complex. With scarce resources, the different outcomes must be evaluated. When addressing a complex problem, there are typically no signs that indicate which are the important relationships that must be maintained and which can be ignored.

Therefore, model-building is a simplification or an abstract representation of an existing problem and choosing what to include and what to exclude requires experience. But there are a number of important steps in model-building that can be useful to managerial decision-making. Managerial economics offers a comprehensive application of economic theory and methodology to management decision-making.

Little (1970)¹ argued that the problem with management models is that managers never use them. But he also argued that the reason can be found in the difficulty of implementing a managerial decision model, and the different language managers use compared with the one used in mathematical models.

If we want a decision-maker to use a model, the decision-maker must perceive the owner of the model.

A decision model should have the following structure:

- a) It should be simple – because it promotes ease of understanding. The most important ‘drivers’ should be included in a model, and the unimportant should be left out.
- b) It should be robust – solutions should include a range of expected values.
- c) It should be easy to control – changes of the model should be easy to do.
- d) It should be updated – a model should be easy to update as new information becomes available.
- e) It should be easy to communicate with – a decision model should easily give ‘what-if’ answers.

Managerial Application 1.1

Business Ethics

In the *Financial Times* you sometimes find evidence of unscrupulous business behaviour. However, unethical conduct is inconsistent with value maximization and contrary to the enlightened self-interest of management and other employees. If honesty didn’t pervade corporations, the ability to conduct business would collapse. Eventually, the truth always comes out, and when it does the unscrupulous lose out. For better or worse, we are known by the standards we adopt. To become successful in business, everyone must adopt a set of principles. Ethical rules to keep in mind when conducting business include:

- Above all else, keep your word. Say what you mean, and mean what you say.
- Do the right thing. A handshake with an honourable person is worth more than a ton of legal documents from a corrupt individual.

- Accept responsibility for your mistakes, and fix them. Be quick to share credit for success.
- Leave something on the table. Profit *with* your customer, not *off* your customer.
- Stick by your principles. Principles are not for sale at any price.

Does the ‘high road’ lead to corporate success? Consider the experience of A.P. Moller–Maersk – a Scandinavian company. The founder of A.P. Moller–Maersk used the phrase ‘no loss should hit us, which by due diligence could be averted’.

The managerial decision-modelling process

There are a number of stages in the managerial decision-making process. The process should be regarded as an iterative process between the stages.

We define the three stages as: 1) Formulation, 2) Solution, 3) Interpretation.

Each of the three stages has its own steps which should be considered. They are:

- 1) **Formulation:** Problem formulation, Model construction, Input data.
- 2) **Solution:** Determining a solution, Testing the solution.
- 3) **Interpretation:** Analyzing and interpretation of the solution, Sensitivity Analysis, Implementation.

1) Formulation

Formulation of the problem is a process where the problem is translated from the practical problem into a mathematical model. A poorly or insufficiently formulated model will result in a bad solution and ultimate misinterpretation. Therefore, the formulation stage can be regarded as a challenge and the most difficult part, and at the same time it also shows the direction and extension of the problem. It is not uncommon that failure of managerial decision-making models can be traced directly back to the formulation of the original problem. The limits of the problem as well as the degree to which it pervades other units of the organization must be included.

- **Problem formulation**

Start by developing a clear and short statement of the problem. Sometimes this initial analysis results in conflicting viewpoints. Identify a specific measurable objective that clearly states the real problem. This objective could very well be the goals of the organization.

- **Model construction**

A managerial decision model is an abstract representation of an existing problem. The essential feature of a managerial decision model is that it involves a set of mathematical relationships, e.g. equations, inequalities, logical dependencies, which correspond to some more down-to-earth relationships in the real world, e.g. technological relationships, marketing constraints, capital, and labour constraints.

Remember that no model can be an exact representation of reality. We are bound to paint a stylized and somewhat distorted picture of the problem. In any model, complex interactions are simplified, and detail is summarized or omitted. Begin with a simple model that just explain a single main effect.

Start by stating the assumptions of the problem and define the variables. These variables can be those that are controllable (i.e., our decision variables), and those variables that are uncontrollable. To distinguish between these more precisely, look at the factors that determine demand. If we identify the factors that affect demand for a product we could distinguish between those that are controllable and those that are uncontrollable factors. Within a company controllable demand factors are price, product, promotion and place. And uncontrollable demand factors are income, taste, competitive factors, government policy, demographic factors, climatic factors, macroeconomic factors, prices of substitutes and complements, etc.

- **Input data**

After having developed a model, we have to find input data to be used in the model. Obtaining data is very important because a well-specified model could be misleading if it contains improper data. Ask yourself what data are relevant, and how the relevant data can be found. It is a good idea to be sensitive to data,

and very useful to check the facts, particularly the numbers that everyone in the organization believes to be true. Sometimes numbers may be myths – justifiers of organizational practice – or they might once have been true.

2) Solution

For many years courses in managerial decision-making focused most of their attention on this step, because the step involved mathematical skills to solve complicated and sometimes complex problems. Here we will move away from the detailed steps of the solution process and instead we will use software packages to do the hard work.

- **Determining a solution**

Determining a solution is an iterative process where the model is used to arrive at the optimal (or best) solution to the problem. Sometimes this may require a set of mathematical equations and sometimes you can use trial-and-error methods and pick the best solution. We will often use a software package to do the more complex computations. These computations often use an algorithm which is a series of steps and procedures that are repeated until a solution has been found.

- **Testing the solution**

Testing the solution is a process of examining whether model and input match. Often test results will cause the model to change in accordance with defects or omissions. If something is missing, you expand the model, and then again check the model and data match. The iteration goes on until the decision-maker is satisfied.

3) Interpretation

Interpreting the results can be a difficult and often professional challenge. It may provide a solution to the problem posed or point to the need to gather additional information.

- **Analyzing and interpretation of the solution**

Analyzing and interpreting the solution will determine the implications and perhaps the problems that a decision can cause. It could give rise to a change of marketplace, prices, costs, or the organization.

- **Sensitivity analysis**

A significant part of the interpretation will be to establish sensitivity analyzes for the proposed solution.

A sensitivity analysis indicates how sensitive the result will be to changes in model parameters and variations. Sensitivity analysis shows how the solution will change with different parameters or input data. Further, the sensitivity analysis can show the dynamics of the model.

- **Implementation**

Implementing the results can be even more challenging. Often it will involve more employees in an organization that may not have understood the entire probability setting, model or solution. It can be a long-standing process that can extend over several years. Changing the IT platform in a company is an example of a change that may extend over time. Another is the modelling and managing the performance of airports.²

THEORY OF THE FIRM

Firms are useful for producing and distributing goods and services.

² Zografos, K., Giovanni A, and Odoni, A. *Modelling and managing airport performance*, Wiley, 2013.

Expected Value Maximization

At its simplest level, a business enterprise represents a series of contractual relationships that specify the rights and responsibilities of various parties (see Figure 1.2). People directly involved include customers, stockholders, management, employees, and suppliers. Society is also involved because businesses use scarce resources, pay taxes, provide employment opportunities, and produce much of society's material and services output. The model of business is called the **theory of the firm**. In its simplest version, the firm is thought to have profit maximization as its primary goal. The firm's owner-manager is assumed to be working to maximize the firm's short-run profits. Today, the emphasis on profits has been broadened to encompass uncertainty and the time value of money. In this more complete model, the primary goal of the firm is long-term **expected value maximization**.

The **value of the firm** is the present value of the firm's expected future net cash flows. If cash flows are equated to profits for simplicity, the value of the firm today, or its **present value**, is the value of expected profits, discounted back to the present at an appropriate interest rate.³

theory of the firm

Basic model of business.

expected value maximization

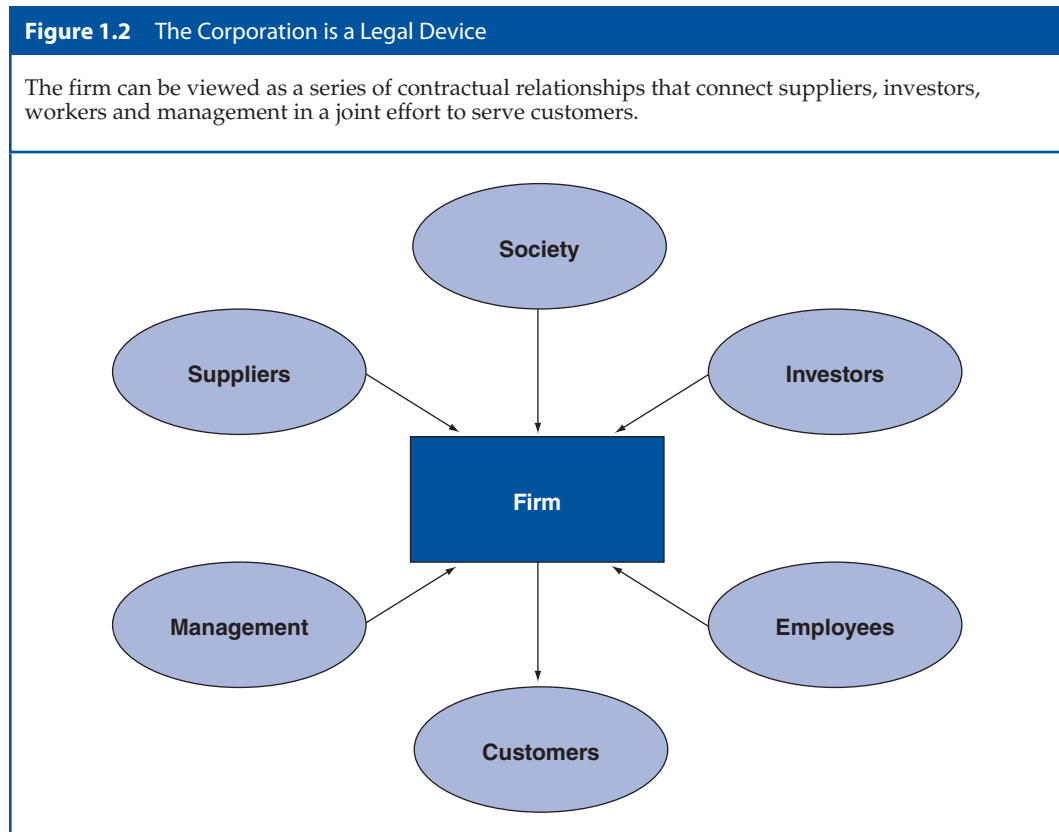

Optimization of profits in light of uncertainty and the time value of money.

value of the firm

Present value of the firm's expected future net cash flows.

present value

Worth in current money.

³ Discounting is required because profits obtained in the future are less valuable than profits earned presently. One euro today is worth more than €1 to be received a year from now because €1 today can be invested and, with interest, grow to a larger amount by the end of the year. One euro invested at 10 per cent interest would grow to €1.10 in one year. Thus, €1 is defined as the present value of €1.10 due in one year when the appropriate interest rate is 10 per cent.

This model can be expressed as follows:

Value of the Firm = Present Value of Expected Future Profits

$$\begin{aligned}
 &= \frac{\pi_1}{(1+i)^1} + \frac{\pi_2}{(1+i)^2} + \dots + \frac{\pi_n}{(1+i)^n} \\
 &= \sum_{t=1}^n \frac{\pi_t}{(1+i)^t}
 \end{aligned}
 \tag{1.1}$$

Here, $\pi_1, \pi_2, \dots, \pi_n$ represent expected profits in each year, t , and i is the appropriate interest, or discount, rate. The final form for Equation (1.1) is simply a shorthand expression in which sigma (Σ) stands for 'sum up' or 'add together'. The term

$$\sum_{t=1}^n$$

means, 'Add together as t goes from 1 to n the values of the term on the right'. For Equation (1.1), the process is as follows: Let $t=1$ and find the value of the term $\pi_1/(1+i)^1$, the present value of year 1 profit; then let $t=2$ and calculate $\pi_2/(1+i)^2$, the present value of year 2 profit; continue until $t=n$, the last year included in the analysis; then add up these present value equivalents of yearly profits to find the current or present value of the firm.

Because profits (π) are equal to total revenues (TR) minus total costs (TC), Equation (1.1) can be rewritten as:

$$\text{Value} = \sum_{t=1}^n \frac{TR_t - TC_t}{(1+i)^t}
 \tag{1.2}$$

This expanded equation can be used to examine how the expected value maximization model relates to a firm's various functional departments. The marketing department often has primary responsibility for promotion and sales (TR); the production department has primary responsibility for development costs (TC); and the finance department has primary responsibility for acquiring capital and, hence, for the discount factor (i) in the denominator. Important overlaps exist among these functional areas. The marketing department can help reduce costs for a given level of output by influencing customer order size and timing. The production department can stimulate sales by improving quality. Other departments, for example, accounting, human resources, transportation and engineering, provide information and services vital to sales growth and cost control. The determination of TR and TC is a difficult and complex task. All managerial decisions should be analyzed in terms of their effects on value, as expressed in Equations (1.1) and (1.2).

Constraints and the Theory of the Firm

Organizations frequently face limited availability of essential inputs, such as skilled labour, raw materials, energy, specialized machinery and warehouse space. Managers often face limitations on the amount of investment funds available for a particular project or activity. Decisions can also be constrained by contractual requirements. For example, labour contracts limit flexibility in worker scheduling and job assignments. Contracts sometimes require that a minimum level of output be produced to meet delivery requirements. In most instances, output must also meet quality requirements. Some common examples of output quality constraints are nutritional requirements for feed mixtures, audience exposure requirements for marketing promotions, reliability requirements for electronic products, and customer service requirements for minimum satisfaction levels.
