ABOUT THE AUTHORS xvi

PART ONE

MODELING, COMPUTERS, AND ERROR ANALYSIS 3

PT1.1 Motivation 3
PT1.2 Mathematical Background 5
PT1.3 Orientation 8

CHAPTER 1

Mathematical Modeling and Engineering Problem Solving 11

1.1 A Simple Mathematical Model 11
1.2 Conservation Laws and Engineering Problems 18

CHAPTER 2

Programming and Software 27

2.1 Packages and Programming 27
2.2 Structured Programming 28
2.3 Modular Programming 37
2.4 Excel 39
2.5 MATLAB 43
2.6 Mathcad 47
2.7 Other Languages and Libraries 48
Problems 49

CHAPTER 3

Approximations and Round-Off Errors 55

3.1 Significant Figures 56
3.2 Accuracy and Precision 58
3.3 Error Definitions 59
3.4 Round-Off Errors 65
Problems 79

CHAPTER 4**Truncation Errors and the Taylor Series 81**

- 4.1 The Taylor Series 81
 - 4.2 Error Propagation 97
 - 4.3 Total Numerical Error 101
 - 4.4 Blunders, Formulation Errors, and Data Uncertainty 106
- Problems 108

EPILOGUE: PART ONE 110

- PT1.4 Trade-Offs 110
- PT1.5 Important Relationships and Formulas 113
- PT1.6 Advanced Methods and Additional References 113

PART TWO**ROOTS OF EQUATIONS 117**

- PT2.1 Motivation 117
- PT2.2 Mathematical Background 119
- PT2.3 Orientation 120

CHAPTER 5**Bracketing Methods 123**

- 5.1 Graphical Methods 123
 - 5.2 The Bisection Method 127
 - 5.3 The False-Position Method 135
 - 5.4 Incremental Searches and Determining Initial Guesses 141
- Problems 142

CHAPTER 6**Open Methods 145**

- 6.1 Simple Fixed-Point Iteration 146
 - 6.2 The Newton-Raphson Method 151
 - 6.3 The Secant Method 157
 - 6.4 Brent's Method 162
 - 6.5 Multiple Roots 166
 - 6.6 Systems of Nonlinear Equations 169
- Problems 173

CHAPTER 7**Roots of Polynomials 176**

- 7.1 Polynomials in Engineering and Science 176
- 7.2 Computing with Polynomials 179
- 7.3 Conventional Methods 182

- 7.4 Müller's Method 183
- 7.5 Bairstow's Method 187
- 7.6 Other Methods 192
- 7.7 Root Location with Software Packages 192
- Problems 202

CHAPTER 8

Case Studies: Roots of Equations 204

- 8.1 Ideal and Nonideal Gas Laws (Chemical/Bio Engineering) 204
- 8.2 Greenhouse Gases and Rainwater (Civil/Environmental Engineering) 207
- 8.3 Design of an Electric Circuit (Electrical Engineering) 209
- 8.4 Pipe Friction (Mechanical/Aerospace Engineering) 212
- Problems 215

EPILOGUE: PART TWO 226

- PT2.4 Trade-Offs 226
- PT2.5 Important Relationships and Formulas 227
- PT2.6 Advanced Methods and Additional References 227

PART THREE

LINEAR ALGEBRAIC EQUATIONS 231

- PT3.1 Motivation 231
- PT3.2 Mathematical Background 233
- PT3.3 Orientation 241

CHAPTER 9

Gauss Elimination 245

- 9.1 Solving Small Numbers of Equations 245
- 9.2 Naive Gauss Elimination 252
- 9.3 Pitfalls of Elimination Methods 258
- 9.4 Techniques for Improving Solutions 264
- 9.5 Complex Systems 271
- 9.6 Nonlinear Systems of Equations 271
- 9.7 Gauss-Jordan 273
- 9.8 Summary 275
- Problems 275

CHAPTER 10

LU Decomposition and Matrix Inversion 278

- 10.1 LU Decomposition 278
- 10.2 The Matrix Inverse 287
- 10.3 Error Analysis and System Condition 291
- Problems 297

CHAPTER 11**Special Matrices and Gauss-Seidel 300**

- 11.1 Special Matrices 300
- 11.2 Gauss-Seidel 304
- 11.3 Linear Algebraic Equations with Software Packages 311
- Problems 316

CHAPTER 12**Case Studies: Linear Algebraic Equations 319**

- 12.1 Steady-State Analysis of a System of Reactors (Chemical/Bio Engineering) 319
- 12.2 Analysis of a Statically Determinate Truss (Civil/Environmental Engineering) 322
- 12.3 Currents and Voltages in Resistor Circuits (Electrical Engineering) 326
- 12.4 Spring-Mass Systems (Mechanical/Aerospace Engineering) 328
- Problems 331

EPILOGUE: PART THREE 341

- PT3.4 Trade-Offs 341
- PT3.5 Important Relationships and Formulas 342
- PT3.6 Advanced Methods and Additional References 342

PART FOUR**OPTIMIZATION 345**

- PT4.1 Motivation 345
- PT4.2 Mathematical Background 350
- PT4.3 Orientation 351

CHAPTER 13**One-Dimensional Unconstrained Optimization 355**

- 13.1 Golden-Section Search 356
- 13.2 Parabolic Interpolation 363
- 13.3 Newton's Method 365
- 13.4 Brent's Method 366
- Problems 368

CHAPTER 14**Multidimensional Unconstrained Optimization 370**

- 14.1 Direct Methods 371
- 14.2 Gradient Methods 375
- Problems 388

CHAPTER 15
Constrained Optimization 390

- 15.1 Linear Programming 390
- 15.2 Nonlinear Constrained Optimization 401
- 15.3 Optimization with Software Packages 402
- Problems 413

CHAPTER 16
Case Studies: Optimization 416

- 16.1 Least-Cost Design of a Tank (Chemical/Bio Engineering) 416
- 16.2 Least-Cost Treatment of Wastewater (Civil/Environmental Engineering) 421
- 16.3 Maximum Power Transfer for a Circuit (Electrical Engineering) 425
- 16.4 Equilibrium and Minimum Potential Energy (Mechanical/Aerospace Engineering) 429
- Problems 431

EPILOGUE: PART FOUR 438

- PT4.4 Trade-Offs 438
- PT4.5 Additional References 439

PART FIVE

CURVE FITTING 441

- PT5.1 Motivation 441
- PT5.2 Mathematical Background 443
- PT5.3 Orientation 452

CHAPTER 17
Least-Squares Regression 456

- 17.1 Linear Regression 456
- 17.2 Polynomial Regression 472
- 17.3 Multiple Linear Regression 476
- 17.4 General Linear Least Squares 479
- 17.5 Nonlinear Regression 483
- Problems 487

CHAPTER 18
Interpolation 490

- 18.1 Newton's Divided-Difference Interpolating Polynomials 491
- 18.2 Lagrange Interpolating Polynomials 502
- 18.3 Coefficients of an Interpolating Polynomial 507
- 18.4 Inverse Interpolation 507
- 18.5 Additional Comments 508
- 18.6 Spline Interpolation 511
- 18.7 Multidimensional Interpolation 521
- Problems 524

CHAPTER 19**Fourier Approximation 526**

- 19.1 Curve Fitting with Sinusoidal Functions 527
- 19.2 Continuous Fourier Series 533
- 19.3 Frequency and Time Domains 536
- 19.4 Fourier Integral and Transform 540
- 19.5 Discrete Fourier Transform (DFT) 542
- 19.6 Fast Fourier Transform (FFT) 544
- 19.7 The Power Spectrum 551
- 19.8 Curve Fitting with Software Packages 552
- Problems 561

CHAPTER 20**Case Studies: Curve Fitting 563**

- 20.1 Linear Regression and Population Models (Chemical/Bio Engineering) 563
- 20.2 Use of Splines to Estimate Heat Transfer (Civil/Environmental Engineering) 567
- 20.3 Fourier Analysis (Electrical Engineering) 569
- 20.4 Analysis of Experimental Data (Mechanical/Aerospace Engineering) 570
- Problems 572

EPILOGUE: PART FIVE 582

- PT5.4 Trade-Offs 582
- PT5.5 Important Relationships and Formulas 583
- PT5.6 Advanced Methods and Additional References 584

PART SIX**NUMERICAL
DIFFERENTIATION
AND
INTEGRATION 587**

- PT6.1 Motivation 587
- PT6.2 Mathematical Background 597
- PT6.3 Orientation 599

CHAPTER 21**Newton-Cotes Integration Formulas 603**

- 21.1 The Trapezoidal Rule 605
- 21.2 Simpson's Rules 615
- 21.3 Integration with Unequal Segments 624
- 21.4 Open Integration Formulas 627
- 21.5 Multiple Integrals 627
- Problems 629

CHAPTER 22**Integration of Equations 633**

- 22.1 Newton-Cotes Algorithms for Equations 633
- 22.2 Romberg Integration 634
- 22.3 Adaptive Quadrature 640
- 22.4 Gauss Quadrature 642
- 22.5 Improper Integrals 650
- Problems 653

CHAPTER 23**Numerical Differentiation 655**

- 23.1 High-Accuracy Differentiation Formulas 655
- 23.2 Richardson Extrapolation 658
- 23.3 Derivatives of Unequally Spaced Data 660
- 23.4 Derivatives and Integrals for Data with Errors 661
- 23.5 Partial Derivatives 662
- 23.6 Numerical Integration/Differentiation with Software Packages 663
- Problems 670

CHAPTER 24**Case Studies: Numerical Integration and Differentiation 673**

- 24.1 Integration to Determine the Total Quantity of Heat (Chemical/Bio Engineering) 673
- 24.2 Effective Force on the Mast of a Racing Sailboat (Civil/Environmental Engineering) 675
- 24.3 Root-Mean-Square Current by Numerical Integration (Electrical Engineering) 677
- 24.4 Numerical Integration to Compute Work (Mechanical/Aerospace Engineering) 680
- Problems 684

EPILOGUE: PART SIX 694

- PT6.4 Trade-Offs 694
- PT6.5 Important Relationships and Formulas 695
- PT6.6 Advanced Methods and Additional References 695

PART SEVEN**ORDINARY

Runge-Kutta Methods 709

- 25.1 Euler's Method 710
- 25.2 Improvements of Euler's Method 721
- 25.3 Runge-Kutta Methods 729
- 25.4 Systems of Equations 739
- 25.5 Adaptive Runge-Kutta Methods 744
- Problems 752

CHAPTER 26
Stiffness and Multistep Methods 755

- 26.1 Stiffness 755
- 26.2 Multistep Methods 759
- Problems 779

CHAPTER 27
Boundary-Value and Eigenvalue Problems 781

- 27.1 General Methods for Boundary-Value Problems 782
- 27.2 Eigenvalue Problems 789
- 27.3 Odes and Eigenvalues with Software Packages 801
- Problems 808

CHAPTER 28
Case Studies: Ordinary Differential Equations 811

- 28.1 Using ODEs to Analyze the Transient Response of a Reactor (Chemical/Bio Engineering) 811
- 28.2 Predator-Prey Models and Chaos (Civil/Environmental Engineering) 818
- 28.3 Simulating Transient Current for an Electric Circuit (Electrical Engineering) 822
- 28.4 The Swinging Pendulum (Mechanical/Aerospace Engineering) 827
- Problems 831

EPILOGUE: PART SEVEN 841

- PT7.4 Trade-Offs 841
- PT7.5 Important Relationships and Formulas 842
- PT7.6 Advanced Methods and Additional References 842

PART EIGHT**PARTIAL
DIFFERENTIAL
EQUATIONS 845**

- PT8.1 Motivation 845
- PT8.2 Orientation 848

CHAPTER 29**Finite Difference: Elliptic Equations 852**

- 29.1 The Laplace Equation 852
- 29.2 Solution Technique 854
- 29.3 Boundary Conditions 860
- 29.4 The Control-Volume Approach 866
- 29.5 Software to Solve Elliptic Equations 869
- Problems 870

CHAPTER 30**Finite Difference: Parabolic Equations 873**

- 30.1 The Heat-Conduction Equation 873
- 30.2 Explicit Methods 874
- 30.3 A Simple Implicit Method 878
- 30.4 The Crank-Nicolson Method 882
- 30.5 Parabolic Equations in Two Spatial Dimensions 885
- Problems 888

CHAPTER 31**Finite-Element Method 890**

- 31.1 The General Approach 891
- 31.2 Finite-Element Application in One Dimension 895
- 31.3 Two-Dimensional Problems 904
- 31.4 Solving PDEs with Software Packages 908
- Problems 912

CHAPTER 32**Case Studies: Partial Differential Equations 915**

- 32.1 One-Dimensional Mass Balance of a Reactor (Chemical/Bio Engineering) 915
- 32.2 Deflections of a Plate (Civil/Environmental Engineering) 919
- 32.3 Two-Dimensional Electrostatic Field Problems (Electrical Engineering) 921
- 32.4 Finite-Element Solution of a Series of Springs (Mechanical/Aerospace Engineering) 924
- Problems 928

PREFACE

It has been over twenty years since we published the first edition of this book. Over that period, our original contention that numerical methods and computers would figure more prominently in the engineering curriculum—particularly in the early parts—has been dramatically borne out. Many universities now offer freshman, sophomore, and junior courses in both introductory computing and numerical methods. In addition, many of our colleagues are integrating computer-oriented problems into other courses at all levels of the curriculum. Thus, this new edition is still founded on the basic premise that student engineers should be provided with a strong and early introduction to numerical methods. Consequently, although we have expanded our coverage in the new edition, we have tried to maintain many of the features that made the first edition accessible to both lower- and upper-level undergraduates. These include:

- **Problem Orientation.** Engineering students learn best when they are motivated by problems. This is particularly true for mathematics and computing. Consequently, we have approached numerical methods from a problem-solving perspective.
- **Student-Oriented Pedagogy.** We have developed a number of features to make this book as student-friendly as possible. These include the overall organization, the use of introductions and epilogues to consolidate major topics and the extensive use of worked examples and case studies from all areas of engineering. We have also endeavored to keep our explanations straightforward and oriented practically.
- **Computational Tools.** We empower our students by helping them utilize the standard “point-and-shoot” numerical problem-solving capabilities of packages like Excel, MATLAB, and Mathcad software. However, students are also shown how to develop simple, well-structured programs to extend the base capabilities of those environments. This knowledge carries over to standard programming languages such as Visual Basic, Fortran 90, and C/C++. We believe that the current flight from computer programming represents something of a “dumbing down” of the engineering curriculum. The bottom line is that as long as engineers are not content to be tool limited, they will have to write code. Only now they may be called “macros” or “M-files.” This book is designed to empower them to do that.

Beyond these five original principles, the seventh edition has new and expanded problem sets. Most of the problems have been modified so that they yield different numerical solutions from previous editions. In addition, a variety of new problems have been included.

The seventh edition also includes **McGraw-Hill’s Connect[®] Engineering**. This online homework management tool allows assignment of algorithmic problems for homework, quizzes, and tests. It connects students with the tools and resources they’ll need to achieve success. To learn more, visit www.mcgrawhillconnect.com.

McGraw-Hill LearnSmart[™] is also available as an integrated feature of McGraw-Hill Connect[®] Engineering. It is an adaptive learning system designed to help students learn faster, study more efficiently, and retain more knowledge for greater success. LearnSmart assesses

a student's knowledge of course content through a series of adaptive questions. It pinpoints concepts the student does not understand and maps out a personalized study plan for success. Visit the following site for a demonstration. www.mhlearnsmart.com

As always, our primary intent in writing this book is to provide students with a sound introduction to numerical methods. We believe that motivated students who enjoy numerical methods, computers, and mathematics will, in the end, make better engineers. If our book fosters an enthusiasm for these subjects, we will consider our efforts a success.

Acknowledgments. We would like to thank our friends at McGraw-Hill. In particular, Lorraine Buczek and Bill Stenquist, who provided a positive and supportive atmosphere for creating this edition. As usual, Beatrice Sussman did a masterful job of copyediting the manuscript and Arpana Kumari of Aptara also did an outstanding job in the book's final production phase. As in past editions, David Clough (University of Colorado), Mike Gustafson (Duke), and Jerry Stedinger (Cornell University) generously shared their insights and suggestions. Useful suggestions were also made by Bill Philpot (Cornell University), Jim Guilkey (University of Utah), Dong-Il Seo (Chungnam National University, Korea), Niall Broekhuizen (NIWA, New Zealand), and Raymundo Cordero and Karim Muci (ITESM, Mexico). The present edition has also benefited from the reviews and suggestions by the following colleagues:

Betty Barr, University of Houston
Jalal Behzadi, Shahid Chamran University
Jordan Berg, Texas Tech University
Jacob Bishop, Utah State University
Estelle M. Eke, California State University, Sacramento
Yazan A. Hussain, Jordan University of Science & Technology
Yogesh Jaluria, Rutgers University
S. Graham Kelly, The University of Akron
Subha Kumpaty, Milwaukee School of Engineering
Eckart Meiburg, University of California-Santa Barbara
Prashant Mhaskar, McMaster University
Luke Olson, University of Illinois at Urbana-Champaign
Richard Pates Jr., Old Dominion University
Joseph H. Pierluissi, University of Texas at El Paso
Juan Perán, Universidad Nacional de Educación a Distancia (UNED)
Scott A. Socolofsky, Texas A&M University

It should be stressed that although we received useful advice from the aforementioned individuals, we are responsible for any inaccuracies or mistakes you may detect in this edition. Please contact Steve Chapra via e-mail if you should detect any errors in this edition.

Finally, we would like to thank our family, friends, and students for their enduring patience and support. In particular, Cynthia Chapra, Danielle Husley, and Claire Canale are always there providing understanding, perspective, and love.

Raymond P. Canale
Lake Leelanau, Michigan

ABOUT THE AUTHORS

Steve Chapra teaches in the Civil and Environmental Engineering Department at Tufts University where he holds the Louis Berger Chair in Computing and Engineering. His other books include *Surface Water-Quality Modeling* and *Applied Numerical Methods with MATLAB*.

Dr. Chapra received engineering degrees from Manhattan College and the University of Michigan. Before joining the faculty at Tufts, he worked for the Environmental Protection Agency and the National Oceanic and Atmospheric Administration, and taught at Texas A&M University and the University of Colorado. His general research interests focus on surface water-quality modeling and advanced computer applications in environmental engineering.

He is a Fellow of the ASCE, and has received a number of awards for his scholarly contributions, including the Rudolph Hering Medal (ASCE), and the Meriam-Wiley Distinguished Author Award (American Society for Engineering Education). He has also been recognized as the outstanding teacher among the engineering faculties at Texas A&M University, the University of Colorado, and Tufts University.

Raymond P. Canale is an emeritus professor at the University of Michigan. During his over 20-year career at the university, he taught numerous courses in the area of computers, numerical methods, and environmental engineering. He also directed extensive research programs in the area of mathematical and computer modeling of aquatic ecosystems. He has authored or coauthored several books and has published over 100 scientific papers and reports. He has also designed and developed personal computer software to facilitate engineering education and the solution of engineering problems. He has been given the Meriam-Wiley Distinguished Author Award by the American Society for Engineering Education for his books and software and several awards for his technical publications.

Professor Canale is now devoting his energies to applied problems, where he works with engineering firms and industry and governmental agencies as a consultant and expert witness.

Numerical Methods for Engineers

PART ONE

MODELING, COMPUTERS, AND ERROR ANALYSIS

PT1.1 MOTIVATION

Numerical methods are techniques by which mathematical problems are formulated so that they can be solved with arithmetic operations. Although there are many kinds of numerical methods, they have one common characteristic: they invariably involve large numbers of tedious arithmetic calculations. It is little wonder that with the development of fast, efficient digital computers, the role of numerical methods in engineering problem solving has increased dramatically in recent years.

PT1.1.1 Noncomputer Methods

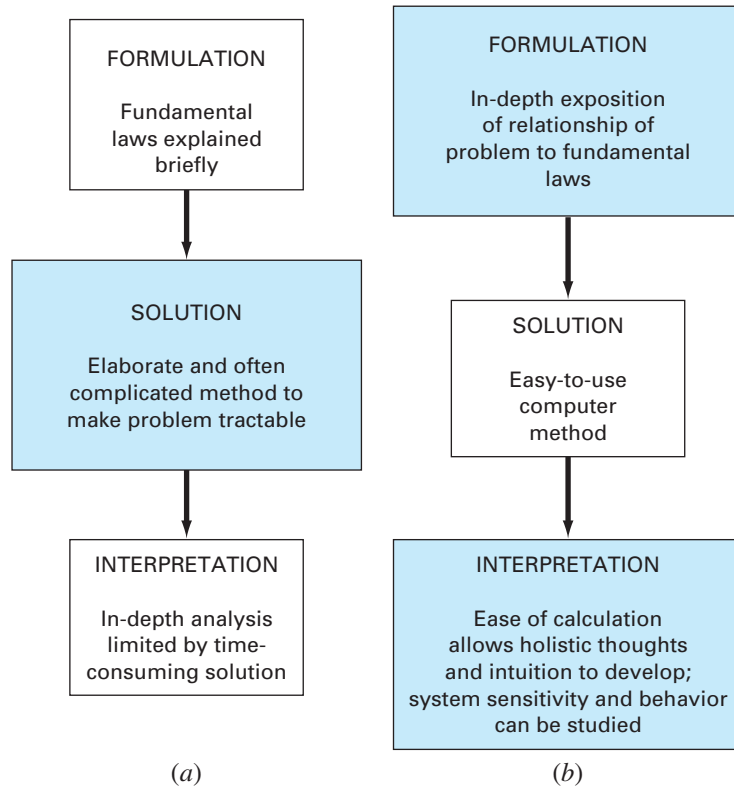

Beyond providing increased computational firepower, the widespread availability of computers (especially personal computers) and their partnership with numerical methods has had a significant influence on the actual engineering problem-solving process. In the precomputer era there were generally three different ways in which engineers approached problem solving:

1. Solutions were derived for some problems using analytical, or exact, methods. These solutions were often useful and provided excellent insight into the behavior of some systems. However, analytical solutions can be derived for only a limited class of problems. These include those that can be approximated with linear models and those that have simple geometry and low dimensionality. Consequently, analytical solutions are of limited practical value because most real problems are nonlinear and involve complex shapes and processes.
2. Graphical solutions were used to characterize the behavior of systems. These graphical solutions usually took the form of plots or nomographs. Although graphical techniques can often be used to solve complex problems, the results are not very precise. Furthermore, graphical solutions (without the aid of computers) are extremely tedious and awkward to implement. Finally, graphical techniques are often limited to problems that can be described using three or fewer dimensions.
3. Calculators and slide rules were used to implement numerical methods manually. Although in theory such approaches should be perfectly adequate for solving complex problems, in actuality several difficulties are encountered. Manual calculations are slow and tedious. Furthermore, consistent results are elusive because of simple blunders that arise when numerous manual tasks are performed.

During the precomputer era, significant amounts of energy were expended on the solution technique itself, rather than on problem definition and interpretation (Fig. PT1.1a). This unfortunate situation existed because so much time and drudgery were required to obtain numerical answers using precomputer techniques.

FIGURE PT1.1

The three phases of engineering problem solving in (a) the precomputer and (b) the computer era. The sizes of the boxes indicate the level of emphasis directed toward each phase. Computers facilitate the implementation of solution techniques and thus allow more emphasis to be placed on the creative aspects of problem formulation and interpretation of results.

Today, computers and numerical methods provide an alternative for such complicated calculations. Using computer power to obtain solutions directly, you can approach these calculations without recourse to simplifying assumptions or time-intensive techniques. Although analytical solutions are still extremely valuable both for problem solving and for providing insight, numerical methods represent alternatives that greatly enlarge your capabilities to confront and solve problems. As a result, more time is available for the use of your creative skills. Thus, more emphasis can be placed on problem formulation and solution interpretation and the incorporation of total system, or “holistic,” awareness (Fig. PT1.1*b*).

PT1.1.2 Numerical Methods and Engineering Practice

Since the late 1940s the widespread availability of digital computers has led to a veritable explosion in the use and development of numerical methods. At first, this growth was somewhat limited by the cost of access to large mainframe computers, and, consequently, many engineers continued to use simple analytical approaches in a significant portion of their work. Needless to say, the recent evolution of inexpensive personal

computers has given us ready access to powerful computational capabilities. There are several additional reasons why you should study numerical methods:

1. Numerical methods are extremely powerful problem-solving tools. They are capable of handling large systems of equations, nonlinearities, and complicated geometries that are not uncommon in engineering practice and that are often impossible to solve analytically. As such, they greatly enhance your problem-solving skills.
2. During your careers, you may often have occasion to use commercially available prepackaged, or “canned,” computer programs that involve numerical methods. The intelligent use of these programs is often predicated on knowledge of the basic theory underlying the methods.
3. Many problems cannot be approached using canned programs. If you are conversant with numerical methods and are adept at computer programming, you can design your own programs to solve problems without having to buy or commission expensive software.
4. Numerical methods are an efficient vehicle for learning to use computers. It is well known that an effective way to learn programming is to actually write computer programs. Because numerical methods are for the most part designed for implementation on computers, they are ideal for this purpose. Further, they are especially well-suited to illustrate the power and the limitations of computers. When you successfully implement numerical methods on a computer and then apply them to solve otherwise intractable problems, you will be provided with a dramatic demonstration of how computers can serve your professional development. At the same time, you will also learn to acknowledge and control the errors of approximation that are part and parcel of large-scale numerical calculations.
5. Numerical methods provide a vehicle for you to reinforce your understanding of mathematics. Because one function of numerical methods is to reduce higher mathematics to basic arithmetic operations, they get at the “nuts and bolts” of some otherwise obscure topics. Enhanced understanding and insight can result from this alternative perspective.

PT1.2 MATHEMATICAL BACKGROUND

Every part in this book requires some mathematical background. Consequently, the introductory material for each part includes a section, such as the one you are reading, on mathematical background. Because Part One itself is devoted to background material on mathematics and computers, this section does not involve a review of a specific mathematical topic. Rather, we take this opportunity to introduce you to the types of mathematical subject areas covered in this book. As summarized in Fig. PT1.2, these are

1. *Roots of Equations* (Fig. PT1.2a). These problems are concerned with the value of a variable or a parameter that satisfies a single nonlinear equation. These problems are especially valuable in engineering design contexts where it is often impossible to explicitly solve design equations for parameters.
2. *Systems of Linear Algebraic Equations* (Fig. PT1.2b). These problems are similar in spirit to roots of equations in the sense that they are concerned with values that

(b) *Part 3: Linear algebraic equations*
Given the a 's and the c 's, solve
 $a_{11}x_1 + a_{12}x_2 = c_1$
 $a_{21}x_1 + a_{22}x_2 = c_2$
for the x 's.

(c) *Part 4: Optimization*
Determine x that gives optimum $f(x)$.

(d) *Part 5: Curve fitting*

(e) *Part 6: Integration*

$$I = \int_a^b f(x) dx$$

Find the area under the curve.

(concluded)

satisfy equations. However, in contrast to satisfying a single equation, a set of values is sought that simultaneously satisfies a set of linear algebraic equations. Such equations arise in a variety of problem contexts and in all disciplines of engineering. In particular, they originate in the mathematical modeling of large systems of interconnected elements such as structures, electric circuits, and fluid networks. However, they are also encountered in other areas of numerical methods such as curve fitting and differential equations.

3. *Optimization* (Fig. PT1.2c). These problems involve determining a value or values of an independent variable that correspond to a “best” or optimal value of a function. Thus, as in Fig. PT1.2c, optimization involves identifying maxima and minima. Such problems occur routinely in engineering design contexts. They also arise in a number of other numerical methods. We address both single- and multi-variable unconstrained optimization. We also describe constrained optimization with particular emphasis on linear programming.
4. *Curve Fitting* (Fig. PT1.2d). You will often have occasion to fit curves to data points. The techniques developed for this purpose can be divided into two general categories: regression and interpolation. Regression is employed where there is a significant degree of error associated with the data. Experimental results are often of this kind. For these situations, the strategy is to derive a single curve that represents the general trend of the data without necessarily matching any individual points. In contrast, interpolation is used where the objective is to determine intermediate values between relatively error-free data points. Such is usually the case for tabulated information. For these situations, the strategy is to fit a curve directly through the data points and use the curve to predict the intermediate values.
5. *Integration* (Fig. PT1.2e). As depicted, a physical interpretation of numerical integration is the determination of the area under a curve. Integration has many

applications in engineering practice, ranging from the determination of the centroids of oddly shaped objects to the calculation of total quantities based on sets of discrete measurements. In addition, numerical integration formulas play an important role in the solution of differential equations.

6. *Ordinary Differential Equations* (Fig. PT1.2f). Ordinary differential equations are of great significance in engineering practice. This is because many physical laws are couched in terms of the rate of change of a quantity rather than the magnitude of the quantity itself. Examples range from population-forecasting models (rate of change of population) to the acceleration of a falling body (rate of change of velocity). Two types of problems are addressed: initial-value and boundary-value problems. In addition, the computation of eigenvalues is covered.
7. *Partial Differential Equations* (Fig. PT1.2g). Partial differential equations are used to characterize engineering systems where the behavior of a physical quantity is couched in terms of its rate of change with respect to two or more independent variables. Examples include the steady-state distribution of temperature on a heated plate (two spatial dimensions) or the time-variable temperature of a heated rod (time and one spatial dimension). Two fundamentally different approaches are employed to solve partial differential equations numerically. In the present text, we will emphasize finite-difference methods that approximate the solution in a pointwise fashion (Fig. PT1.2g). However, we will also present an introduction to finite-element methods, which use a piecewise approach.

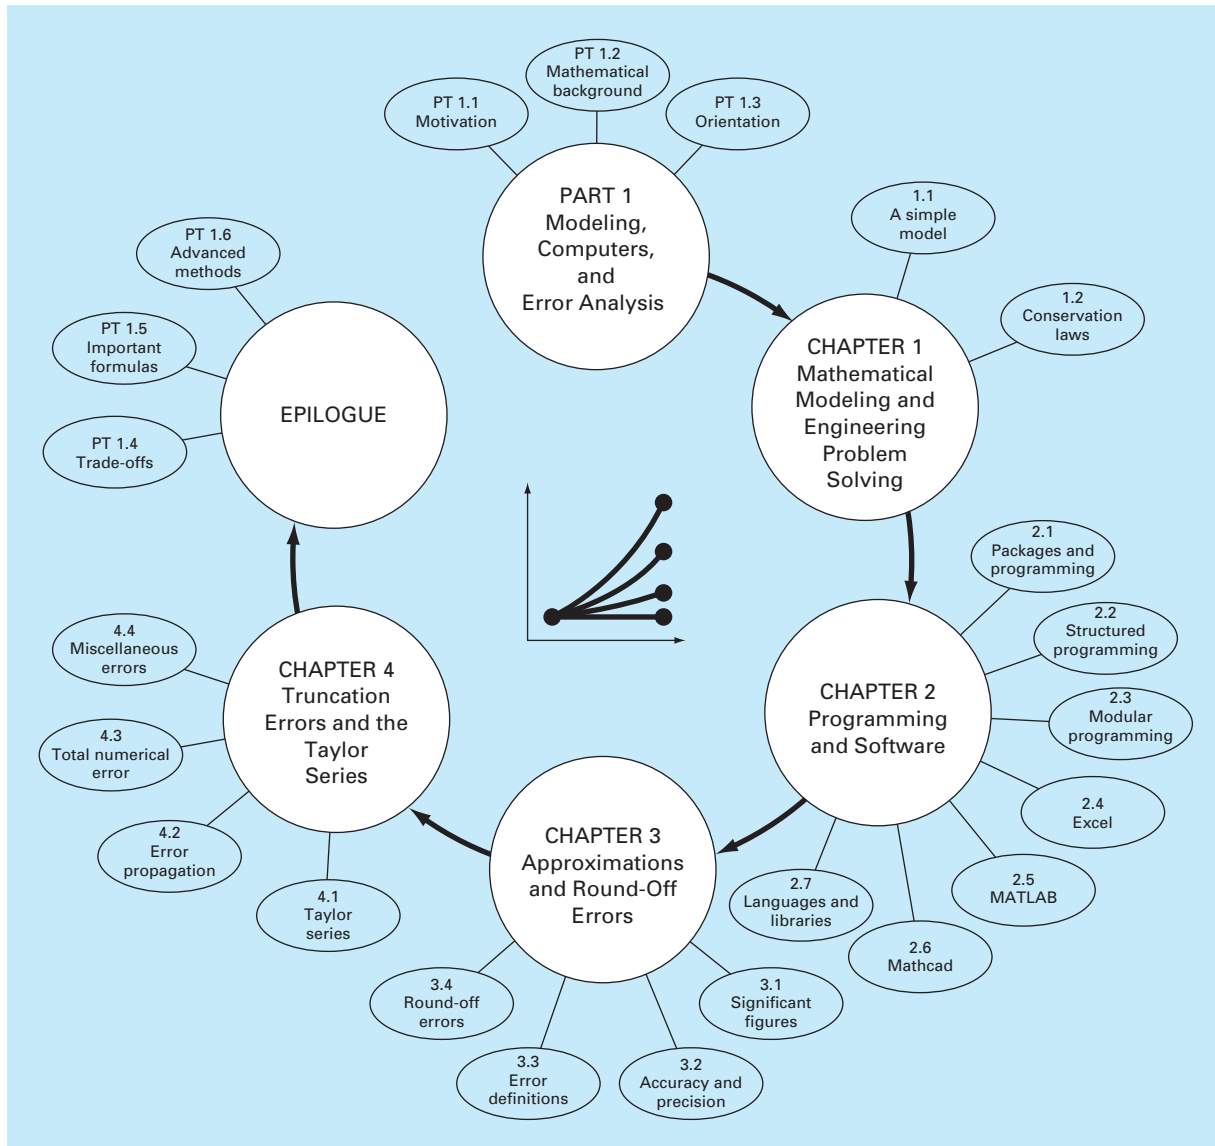

PT1.3 ORIENTATION

Some orientation might be helpful before proceeding with our introduction to numerical methods. The following is intended as an overview of the material in Part One. In addition, some objectives have been included to focus your efforts when studying the material.

PT1.3.1 Scope and Preview

Figure PT1.3 is a schematic representation of the material in Part One. We have designed this diagram to provide you with a global overview of this part of the book. We believe that a sense of the “big picture” is critical to developing insight into numerical methods. When reading a text, it is often possible to become lost in technical details. Whenever you feel that you are losing the big picture, refer back to Fig. PT1.3 to reorient yourself. Every part of this book includes a similar figure.

Figure PT1.3 also serves as a brief preview of the material covered in Part One. *Chapter 1* is designed to orient you to numerical methods and to provide motivation by demonstrating how these techniques can be used in the engineering modeling process. *Chapter 2* is an introduction and review of computer-related aspects of numerical methods and suggests the level of computer skills you should acquire to efficiently apply succeeding information. *Chapters 3* and *4* deal with the important topic of error analysis, which must be understood for the effective use of numerical methods. In addition, an *epilogue* is included that introduces the trade-offs that have such great significance for the effective implementation of numerical methods.
