Contents

Appendices E–H are PDF documents posted online at the book’s Companion Website (located at <https://www.pearsonglobaleditions.com>).

Preface	17
Before You Begin	49
I Introduction to Computers and C	53
1.1 Introduction	54
1.2 Hardware and Software	56
1.2.1 Moore’s Law	56
1.2.2 Computer Organization	57
1.3 Data Hierarchy	60
1.4 Machine Languages, Assembly Languages and High-Level Languages	63
1.5 Operating Systems	65
1.6 The C Programming Language	68
1.7 The C Standard Library and Open-Source Libraries	70
1.8 Other Popular Programming Languages	71
1.9 Typical C Program-Development Environment	73
1.9.1 Phase 1: Creating a Program	73
1.9.2 Phases 2 and 3: Preprocessing and Compiling a C Program	73
1.9.3 Phase 4: Linking	74
1.9.4 Phase 5: Loading	75
1.9.5 Phase 6: Execution	75
1.9.6 Problems That May Occur at Execution Time	75
1.9.7 Standard Input, Standard Output and Standard Error Streams	76
1.10 Test-Driving a C Application in Windows, Linux and macOS	76
1.10.1 Compiling and Running a C Application with Visual Studio 2019 Community Edition on Windows 10	77
1.10.2 Compiling and Running a C Application with Xcode on macOS	81

6 Contents

1.10.3	Compiling and Running a C Application with GNU <code>gcc</code> on Linux	84
1.10.4	Compiling and Running a C Application in a GCC Docker Container Running Natively over Windows 10, macOS or Linux	86
1.11	Internet, World Wide Web, the Cloud and IoT	87
1.11.1	The Internet: A Network of Networks	88
1.11.2	The World Wide Web: Making the Internet User-Friendly	89
1.11.3	The Cloud	89
1.11.4	The Internet of Things	90
1.12	Software Technologies	91
1.13	How Big Is Big Data?	91
1.13.1	Big-Data Analytics	97
1.13.2	Data Science and Big Data Are Making a Difference: Use Cases	98
1.14	Case Study—A Big-Data Mobile Application	99
1.15	AI—at the Intersection of Computer Science and Data Science	100

2 Intro to C Programming 107

2.1	Introduction	108
2.2	A Simple C Program: Printing a Line of Text	108
2.3	Another Simple C Program: Adding Two Integers	112
2.4	Memory Concepts	116
2.5	Arithmetic in C	117
2.6	Decision Making: Equality and Relational Operators	121
2.7	Secure C Programming	125

3 Structured Program Development 137

3.1	Introduction	138
3.2	Algorithms	138
3.3	Pseudocode	139
3.4	Control Structures	140
3.5	The <code>if</code> Selection Statement	142
3.6	The <code>if...else</code> Selection Statement	144
3.7	The <code>while</code> Iteration Statement	148
3.8	Formulating Algorithms Case Study 1: Counter-Controlled Iteration	149
3.9	Formulating Algorithms with Top-Down, Stepwise Refinement Case Study 2: Sentinel-Controlled Iteration	151
3.10	Formulating Algorithms with Top-Down, Stepwise Refinement Case Study 3: Nested Control Statements	158
3.11	Assignment Operators	162
3.12	Increment and Decrement Operators	163
3.13	Secure C Programming	166

4	Program Control	185
4.1	Introduction	186
4.2	Iteration Essentials	186
4.3	Counter-Controlled Iteration	187
4.4	for Iteration Statement	188
4.5	Examples Using the for Statement	192
4.6	switch Multiple-Selection Statement	196
4.7	do...while Iteration Statement	202
4.8	break and continue Statements	203
4.9	Logical Operators	205
4.10	Confusing Equality (==) and Assignment (=) Operators	209
4.11	Structured-Programming Summary	210
4.12	Secure C Programming	215
5	Functions	231
5.1	Introduction	232
5.2	Modularizing Programs in C	232
5.3	Math Library Functions	234
5.4	Functions	235
5.5	Function Definitions	236
	5.5.1 square Function	236
	5.5.2 maximum Function	239
5.6	Function Prototypes: A Deeper Look	240
5.7	Function-Call Stack and Stack Frames	243
5.8	Headers	247
5.9	Passing Arguments by Value and by Reference	249
5.10	Random-Number Generation	249
5.11	Game Simulation Case Study: Rock, Paper, Scissors	254
5.12	Storage Classes	260
5.13	Scope Rules	262
5.14	Recursion	265
5.15	Example Using Recursion: Fibonacci Series	269
5.16	Recursion vs. Iteration	272
5.17	Secure C Programming—Secure Random-Number Generation	275
	Random-Number Simulation Case Study: The Tortoise and the Hare	294
6	Arrays	297
6.1	Introduction	298
6.2	Arrays	298
6.3	Defining Arrays	300
6.4	Array Examples	300

6.4.1	Defining an Array and Using a Loop to Set the Array's Element Values	301
6.4.2	Initializing an Array in a Definition with an Initializer List	302
6.4.3	Specifying an Array's Size with a Symbolic Constant and Initializing Array Elements with Calculations	303
6.4.4	Summing the Elements of an Array	304
6.4.5	Using Arrays to Summarize Survey Results	304
6.4.6	Graphing Array Element Values with Bar Charts	306
6.4.7	Rolling a Die 60,000,000 Times and Summarizing the Results in an Array	307
6.5	Using Character Arrays to Store and Manipulate Strings	309
6.5.1	Initializing a Character Array with a String	309
6.5.2	Initializing a Character Array with an Initializer List of Characters	309
6.5.3	Accessing the Characters in a String	309
6.5.4	Inputting into a Character Array	309
6.5.5	Outputting a Character Array That Represents a String	310
6.5.6	Demonstrating Character Arrays	310
6.6	Static Local Arrays and Automatic Local Arrays	312
6.7	Passing Arrays to Functions	314
6.8	Sorting Arrays	318
6.9	Intro to Data Science Case Study: Survey Data Analysis	321
6.10	Searching Arrays	326
6.10.1	Searching an Array with Linear Search	326
6.10.2	Searching an Array with Binary Search	328
6.11	Multidimensional Arrays	332
6.11.1	Illustrating a Two-Dimensional Array	332
6.11.2	Initializing a Double-Subscripted Array	333
6.11.3	Setting the Elements in One Row	335
6.11.4	Totaling the Elements in a Two-Dimensional Array	335
6.11.5	Two-Dimensional Array Manipulations	335
6.12	Variable-Length Arrays	339
6.13	Secure C Programming	343

7 Pointers **363**

7.1	Introduction	364
7.2	Pointer Variable Definitions and Initialization	365
7.3	Pointer Operators	366
7.4	Passing Arguments to Functions by Reference	369
7.5	Using the const Qualifier with Pointers	373
7.5.1	Converting a String to Uppercase Using a Non-Constant Pointer to Non-Constant Data	374

7.5.2	Printing a String One Character at a Time Using a Non-Constant Pointer to Constant Data	374
7.5.3	Attempting to Modify a Constant Pointer to Non-Constant Data	376
7.5.4	Attempting to Modify a Constant Pointer to Constant Data	377
7.6	Bubble Sort Using Pass-By-Reference	378
7.7	sizeof Operator	382
7.8	Pointer Expressions and Pointer Arithmetic	384
7.8.1	Pointer Arithmetic Operators	385
7.8.2	Aiming a Pointer at an Array	385
7.8.3	Adding an Integer to a Pointer	385
7.8.4	Subtracting an Integer from a Pointer	386
7.8.5	Incrementing and Decrementing a Pointer	386
7.8.6	Subtracting One Pointer from Another	386
7.8.7	Assigning Pointers to One Another	386
7.8.8	Pointer to void	386
7.8.9	Comparing Pointers	387
7.9	Relationship between Pointers and Arrays	387
7.9.1	Pointer/Offset Notation	387
7.9.2	Pointer/Subscript Notation	388
7.9.3	Cannot Modify an Array Name with Pointer Arithmetic	388
7.9.4	Demonstrating Pointer Subscripting and Offsets	388
7.9.5	String Copying with Arrays and Pointers	390
7.10	Arrays of Pointers	392
7.11	Random-Number Simulation Case Study: Card Shuffling and Dealing	393
7.12	Function Pointers	398
7.12.1	Sorting in Ascending or Descending Order	398
7.12.2	Using Function Pointers to Create a Menu-Driven System	401
7.13	Secure C Programming	403
	Special Section: Building Your Own Computer as a Virtual Machine	417
	Special Section—Embedded Systems Programming Case Study: Robotics with the Webots Simulator	424
8	Characters and Strings	441
8.1	Introduction	442
8.2	Fundamentals of Strings and Characters	442
8.3	Character-Handling Library	444
8.3.1	Functions isdigit, isalpha, isalnum and isxdigit	445
8.3.2	Functions islower, isupper, tolower and toupper	447
8.3.3	Functions isspace, iscntrl, ispunct, isprint and isgraph	448
8.4	String-Conversion Functions	450
8.4.1	Function strtod	450

8.4.2	Function strtol	451
8.4.3	Function strtoul	452
8.5	Standard Input/Output Library Functions	453
8.5.1	Functions fgets and putchar	453
8.5.2	Function getchar	455
8.5.3	Function sprintf	455
8.5.4	Function sscanf	456
8.6	String-Manipulation Functions of the String-Handling Library	457
8.6.1	Functions strcpy and strncpy	458
8.6.2	Functions strcat and strncat	459
8.7	Comparison Functions of the String-Handling Library	460
8.8	Search Functions of the String-Handling Library	462
8.8.1	Function strchr	463
8.8.2	Function strcspn	464
8.8.3	Function strpbrk	464
8.8.4	Function strrchr	465
8.8.5	Function strspn	465
8.8.6	Function strstr	466
8.8.7	Function strtok	467
8.9	Memory Functions of the String-Handling Library	468
8.9.1	Function memcpy	469
8.9.2	Function memmove	470
8.9.3	Function memcmp	470
8.9.4	Function memchr	471
8.9.5	Function memset	471
8.10	Other Functions of the String-Handling Library	473
8.10.1	Function strerror	473
8.10.2	Function strlen	473
8.11	Secure C Programming	474
	Pqyoaf X Nylfomigrob Qwbbfmh Mndogvk: Rboqlrut yua	
	Boklnxhmywex	488
	Secure C Programming Case Study: Public-Key Cryptography	494

9 Formatted Input/Output **503**

9.1	Introduction	504
9.2	Streams	504
9.3	Formatting Output with printf	505
9.4	Printing Integers	506
9.5	Printing Floating-Point Numbers	507
9.5.1	Conversion Specifiers e, E and f	508
9.5.2	Conversion Specifiers g and G	508
9.5.3	Demonstrating Floating-Point Conversion Specifiers	509
9.6	Printing Strings and Characters	510

9.7	Other Conversion Specifiers	511
9.8	Printing with Field Widths and Precision	512
9.8.1	Field Widths for Integers	512
9.8.2	Precisions for Integers, Floating-Point Numbers and Strings	513
9.8.3	Combining Field Widths and Precisions	514
9.9	<code>printf</code> Format Flags	515
9.9.1	Right- and Left-Alignment	515
9.9.2	Printing Positive and Negative Numbers with and without the + Flag	516
9.9.3	Using the Space Flag	516
9.9.4	Using the # Flag	517
9.9.5	Using the 0 Flag	517
9.10	Printing Literals and Escape Sequences	518
9.11	Formatted Input with <code>scanf</code>	519
9.11.1	<code>scanf</code> Syntax	520
9.11.2	<code>scanf</code> Conversion Specifiers	520
9.11.3	Reading Integers	521
9.11.4	Reading Floating-Point Numbers	522
9.11.5	Reading Characters and Strings	522
9.11.6	Using Scan Sets	523
9.11.7	Using Field Widths	524
9.11.8	Skipping Characters in an Input Stream	525
9.12	Secure C Programming	526

10 Structures, Unions, Bit Manipulation and Enumerations **535**

10.1	Introduction	536
10.2	Structure Definitions	537
10.2.1	Self-Referential Structures	537
10.2.2	Defining Variables of Structure Types	538
10.2.3	Structure Tag Names	538
10.2.4	Operations That Can Be Performed on Structures	538
10.3	Initializing Structures	540
10.4	Accessing Structure Members with <code>.</code> and <code>-></code>	540
10.5	Using Structures with Functions	542
10.6	<code>typedef</code>	542
10.7	Random-Number Simulation Case Study: High-Performance Card Shuffling and Dealing	543
10.8	Unions	546
10.8.1	<code>union</code> Declarations	547
10.8.2	Allowed unions Operations	547
10.8.3	Initializing unions in Declarations	547
10.8.4	Demonstrating unions	548

12 Contents

10.9	Bitwise Operators	549
10.9.1	Displaying an Unsigned Integer's Bits	550
10.9.2	Making Function <code>displayBits</code> More Generic and Portable	551
10.9.3	Using the Bitwise AND, Inclusive OR, Exclusive OR and Complement Operators	552
10.9.4	Using the Bitwise Left- and Right-Shift Operators	555
10.9.5	Bitwise Assignment Operators	557
10.10	Bit Fields	558
10.10.1	Defining Bit Fields	558
10.10.2	Using Bit Fields to Represent a Card's Face, Suit and Color	559
10.10.3	Unnamed Bit Fields	561
10.11	Enumeration Constants	561
10.12	Anonymous Structures and Unions	563
10.13	Secure C Programming	564
	Special Section: Raylib Game-Programming Case Studies	574
	Game-Programming Case Study Exercise: SpotOn Game	580
	Game-Programming Case Study: Cannon Game	581
	Visualization with raylib—Law of Large Numbers Animation	583
	Case Study: The Tortoise and the Hare with raylib— a Multimedia “Extravaganza”	585
	Random-Number Simulation Case Study: High-Performance Card Shuffling and Dealing with Card Images and raylib	587

11 File Processing 593

11.1	Introduction	594
11.2	Files and Streams	594
11.3	Creating a Sequential-Access File	596
11.3.1	Pointer to a FILE	597
11.3.2	Using <code>fopen</code> to Open a File	597
11.3.3	Using <code>feof</code> to Check for the End-of-File Indicator	597
11.3.4	Using <code>fprintf</code> to Write to a File	598
11.3.5	Using <code>fclose</code> to Close a File	598
11.3.6	File-Open Modes	599
11.4	Reading Data from a Sequential-Access File	601
11.4.1	Resetting the File Position Pointer	602
11.4.2	Credit Inquiry Program	602
11.5	Random-Access Files	606
11.6	Creating a Random-Access File	607
11.7	Writing Data Randomly to a Random-Access File	609
11.7.1	Positioning the File Position Pointer with <code>fseek</code>	611
11.7.2	Error Checking	612
11.8	Reading Data from a Random-Access File	612

11.9	Case Study: Transaction-Processing System	614
11.10	Secure C Programming	620
	AI Case Study: Intro to NLP—Who Wrote Shakespeare’s Works?	630
	AI/Data-Science Case Study—Machine Learning with GNU Scientific Library	636
	AI/Data-Science Case Study: Time Series and Simple Linear Regression	642
	Web Services and the Cloud Case Study—libcurl and OpenWeatherMap	643
12	Data Structures	649
12.1	Introduction	650
12.2	Self-Referential Structures	651
12.3	Dynamic Memory Management	652
12.4	Linked Lists	653
	12.4.1 Function insert	657
	12.4.2 Function delete	659
	12.4.3 Functions isEmpty and printList	661
12.5	Stacks	662
	12.5.1 Function push	666
	12.5.2 Function pop	667
	12.5.3 Applications of Stacks	667
12.6	Queues	668
	12.6.1 Function enqueue	673
	12.6.2 Function dequeue	674
12.7	Trees	675
	12.7.1 Function insertNode	678
	12.7.2 Traversals: Functions inOrder, preOrder and postOrder	679
	12.7.3 Duplicate Elimination	680
	12.7.4 Binary Tree Search	680
	12.7.5 Other Binary Tree Operations	680
12.8	Secure C Programming	681
	Special Section: Systems Software Case Study—Building Your Own Compiler	690
13	Computer-Science Thinking: Sorting Algorithms and Big O	711
13.1	Introduction	712
13.2	Efficiency of Algorithms: Big O	713
	13.2.1 $O(1)$ Algorithms	713
	13.2.2 $O(n)$ Algorithms	713
	13.2.3 $O(n^2)$ Algorithms	713

14 Contents

13.3	Selection Sort	714
13.3.1	Selection Sort Implementation	715
13.3.2	Efficiency of Selection Sort	718
13.4	Insertion Sort	719
13.4.1	Insertion Sort Implementation	719
13.4.2	Efficiency of Insertion Sort	722
13.5	Case Study: Visualizing the High-Performance Merge Sort	722
13.5.1	Merge Sort Implementation	723
13.5.2	Efficiency of Merge Sort	727
13.5.3	Summarizing Various Algorithms' Big O Notations	728

14 Preprocessor 735

14.1	Introduction	736
14.2	<code>#include</code> Preprocessor Directive	737
14.3	<code>#define</code> Preprocessor Directive: Symbolic Constants	737
14.4	<code>#define</code> Preprocessor Directive: Macros	738
14.4.1	Macro with One Argument	739
14.4.2	Macro with Two Arguments	740
14.4.3	Macro Continuation Character	740
14.4.4	<code>#undef</code> Preprocessor Directive	740
14.4.5	Standard-Library Macros	740
14.4.6	Do Not Place Expressions with Side Effects in Macros	741
14.5	Conditional Compilation	741
14.5.1	<code>#if...#endif</code> Preprocessor Directive	741
14.5.2	Commenting Out Blocks of Code with <code>#if...#endif</code>	742
14.5.3	Conditionally Compiling Debug Code	742
14.6	<code>#error</code> and <code>#pragma</code> Preprocessor Directives	743
14.7	<code>#</code> and <code>##</code> Operators	744
14.8	Line Numbers	744
14.9	Predefined Symbolic Constants	745
14.10	Assertions	745
14.11	Secure C Programming	746

15 Other Topics 753

15.1	Introduction	754
15.2	Variable-Length Argument Lists	754
15.3	Using Command-Line Arguments	756
15.4	Compiling Multiple-Source-File Programs	758
15.4.1	<code>extern</code> Declarations for Global Variables in Other Files	758
15.4.2	Function Prototypes	759
15.4.3	Restricting Scope with <code>static</code>	759
15.5	Program Termination with <code>exit</code> and <code>atexit</code>	760

15.6	Suffixes for Integer and Floating-Point Literals	762
15.7	Signal Handling	762
15.8	Dynamic Memory Allocation Functions <code>calloc</code> and <code>realloc</code>	765
15.9	<code>goto</code> : Unconditional Branching	767

A Operator Precedence Chart 773

B ASCII Character Set 775

C Multithreading/Multicore and Other C18/C11/C99 Topics 777

C.1	Introduction	778
C.2	Headers Added in C99	779
C.3	Designated Initializers and Compound Literals	779
C.4	Type <code>bool</code>	781
C.5	Complex Numbers	782
C.6	Macros with Variable-Length Argument Lists	784
C.7	Other C99 Features	784
C.7.1	Compiler Minimum Resource Limits	784
C.7.2	The <code>restrict</code> Keyword	784
C.7.3	Reliable Integer Division	785
C.7.4	Flexible Array Members	785
C.7.5	Type-Generic Math	786
C.7.6	Inline Functions	786
C.7.7	<code>__func__</code> Predefined Identifier	786
C.7.8	<code>va_copy</code> Macro	787
C.8	C11/C18 Features	787
C.8.1	C11/C18 Headers	787
C.8.2	<code>quick_exit</code> Function	787
C.8.3	Unicode® Support	787
C.8.4	<code>_Noreturn</code> Function Specifier	788
C.8.5	Type-Generic Expressions	788

Preface

An Innovative C Programming Textbook for the 2020s

*Good programmers write code that humans can understand.*¹

—Martin Fowler

*I think that it's extraordinarily important that we in computer science keep fun in computing.*²

—Alan Perlis

Welcome to *C How to Program, Ninth Edition*. We present a friendly, contemporary, code-intensive, case-study-oriented introduction to C—which is among the world's most popular programming languages.³ Whether you're a student, an instructor or a professional programmer, this book has much to offer you. In this Preface, we present the “soul of the book.”

At the heart of the book is the Deitel signature **live-code approach**—we generally present concepts in the context of 147 **complete, working, real-world C programs**, rather than in code snippets. We follow each code example with one or more live program input/output dialogs. All the code is provided free for download at

<https://www.pearsonglobaleditions.com>

You should execute each program in parallel with reading the text, making your learning experience “come alive.”

For many decades:

- computer hardware has rapidly been getting faster, cheaper and smaller,
- Internet bandwidth (that is, its information-carrying capacity) has rapidly been getting larger and cheaper, and
- quality computer software has become ever more abundant and often free or nearly free through the **open-source movement**.

1. Martin Fowler (with contributions by Kent Beck). *Refactoring: Improving the Design of Existing Code*. Addison-Wesley, 1999. p. 15.

2. Alan Perlis, Quoted in the book dedication of *The Structure and Interpretation of Computer Programs, 2/e* by Hal Abelson, Gerald Jay Sussman and Julie Sussman. McGraw-Hill. 1996.

3. Tiobe Index for November 2020. Accessed November 9, 2020. <https://www.tiobe.com/tiobe-index/>.

We'll say lots more about these important trends. The **Internet of Things (IoT)** is already connecting tens of billions of computerized devices of every imaginable type. These generate enormous volumes of data (one form of "**big data**") at rapidly increasing speeds and quantities. And most computing will eventually be performed online in "**the Cloud**"—that is, by using computing services accessible over the Internet.

For the novice, the book's early chapters establish a solid foundation in programming fundamentals. The mid-range to high-end chapters and the 20+ case studies ease novices into the world of professional software-development challenges and practices.

Given the extraordinary performance demands that today's applications place on computer hardware, software and the Internet, professionals often choose C to build the most performance-intensive portions of these applications. Throughout the book, we emphasize performance issues to help you prepare for industry.

The book's modular architecture (see the chart on the inside front cover) makes it appropriate for several audiences:

- **Introductory and intermediate college programming courses** in Computer Science, Computer Engineering, Information Systems, Information Technology, Software Engineering and related disciplines.
- **Science, technology, engineering and math (STEM) college courses** with a programming component.
- **Professional industry training courses.**
- **Experienced professionals** learning C to prepare for upcoming software-development projects.

We've enjoyed writing nine editions of this book over the last 29 years. We hope you'll find *C How to Program, 9/e* informative, challenging and entertaining as you prepare to develop leading-edge, high-performance applications and systems in your career.

New and Updated Features in This Ninth Edition

Here, we briefly overview some of this edition's new and updated features. There are many more. The sections that follow provide more details:

- We added a **one-page color Table of Contents chart** on the inside front cover, making it easy for you to see the entire book from "40,000 feet." This chart emphasizes the book's **modular architecture** and lists most of the case studies.
- Some of the case studies are book sections that walk through the complete source code—these are supported by end-of-chapter exercises that might ask you to modify the code presented in the text or take on related challenges. Some are exercises with detailed specifications from which you should be able to develop the code solution on your own. Some are exercises that ask you to visit websites that contain nice tutorials. And some are exercises that ask you to visit developer websites where there may be code to study, but no tutorials—and the code may not be well commented. Instructors will decide which of the case studies are appropriate for their particular audiences.

- We adhere to the **C11/C18 standards**.
- We tested all the code for correctness on the **Windows, macOS and Linux** operating systems using the latest versions of the **Visual C++, Xcode and GNU gcc compilers**, respectively, noting differences among the platforms. See the **Before You Begin** section that follows this Preface for software installation instructions.
- We used the **clang-tidy static code analysis tool** to check all the code in the book's **code examples** for improvement suggestions, from simple items like **ensuring variables are initialized to warnings about potential security flaws**. We also ran this tool on the code solutions that we make available to instructors for hundreds of the book's exercises. The complete list of code checks can be found at <https://clang.llvm.org/extra/clang-tidy/checks/list.html>.
- GNU gcc tends to be the most compliant C compiler. **To enable macOS and Windows users to use gcc if they wish, Chapter 1 includes a test-drive demonstrating how to compile programs and run them using gcc in the cross-platform GNU Compiler Collection Docker container.**
- We've added **350+ integrated Self-Check exercises**, each followed immediately by its answer. These are ideal for **self study** and for use in "**flipped classrooms**" (see the "Flipped Classrooms" section later in this Preface).
- To ensure that book content is **topical**, we did extensive Internet research on C specifically and the world of computing in general, which influenced our choice of case studies. We show C as it's intended to be used with a rich collection of applications programming and systems programming case studies, focusing on **computer-science, artificial intelligence, data science** and other fields. See the "Case Studies" section later in this Preface for more details.
- In the text, code examples, exercises and case studies, we familiarize students with **current topics of interest to developers**, including open-source software, virtualization, simulation, web services, multithreading, multicore hardware architecture, systems programming, game programming, animation, visualization, 2D and 3D graphics, artificial intelligence, natural language processing, machine learning, robotics, data science, secure programming, cryptography, Docker, GitHub, StackOverflow, forums and more.
- We adhere to the latest **ACM/IEEE computing curricula recommendations**, which call for covering security, data science, ethics, privacy and performance concepts and using real-world data throughout the curriculum. See the "Computing and Data Science Curricula" section for more details.
- Most chapters in this book's recent editions end with **Secure C programming sections** that focus on the SEI CERT C Coding Standard from the CERT group of Carnegie Mellon University's Software Engineering Institute (SEI). For this edition, we tuned the SEI CERT-based sections. We also added **security icons in the page margin** whenever we discuss a security-related issue in the text. All of this is consistent with the **ACM/IEEE computing curricula docu-**

ments’ **enhanced emphasis on security**. See the “Computing and Data Science Curricula” section later in this Preface for a list of the key curricula documents.

- Consistent with our richer treatment of security, we’ve added case studies on secret-key and public-key cryptography. The latter includes a detailed walk-through of the enormously popular RSA algorithm’s steps, providing hints to help you build a working, simple, small-scale implementation.
- We’ve enhanced existing case studies and added new ones focusing on AI and data science, including simulations with random-number generation, survey data analysis, natural language processing (NLP) and artificial intelligence (machine-learning with simple linear regression). Data science is emphasized in the latest ACM/IEEE computing curricula documents.
- We’ve added exercises in which students use the Internet to research **ethics** and **privacy** issues in computing.
- We tuned our **multithreading and multicore performance** case study. We also show a **performance icon in the margin** whenever we discuss a performance-related issue in the text.
- We integrated the previous edition’s hundreds of software-development tips directly into the text for a smoother reading experience. We call out **common errors** and **good software engineering practices** with new margin icons.
- We upgraded our appendix on additional sorting algorithms and analysis of algorithms with Big O to full-chapter status (Chapter 13).
- C programmers often subsequently learn one or more C-based object-oriented languages. We added an appendix that presents a friendly intro to object-oriented programming concepts and terminology. C is a procedural programming language, so this appendix will help students appreciate differences in thinking between C developers and the folks who program in languages like C++, Java, C#, Objective-C, Swift and other object-oriented languages. We do lots of things like this in the book to prepare students for industry.
- Several case studies now have you use free open-source libraries and tools.
- We added a case study that performs visualization with gnuplot.
- We removed the previous edition’s introduction to C++ programming to make room for the hundreds of integrated self-check exercises and our new applications programming and systems programming case studies.
- This new edition is published in a larger font size and page size for enhanced readability.

A Tour of the Book

The **Table of Contents** graphic on the inside front cover shows the book’s **modular architecture**. Instructors can conveniently adapt the content to a variety of courses and audiences. Here we present a brief chapter-by-chapter walkthrough and indicate where

the book's case studies are located. Some are in-chapter examples and some are end-of-chapter exercises. Some are fully coded. For others, you'll develop the solution.

Chapters 1–5 are traditional introductory C programming topics. Chapters 6–11 are intermediate topics forming the high end of Computer Science 1 and related courses. Chapters 12–15 are advanced topics for late CS1 or early CS2 courses. Here's a list of the topical, challenging and often entertaining hands-on case studies.

Systems Programming Case Studies

- **Systems Software**—Building Your Own Computer (as a virtual machine)
- **Systems Software**—Building Your Own Compiler
- **Embedded Systems Programming**—Robotics, 3D graphics and animation with the Webots Simulator
- **Performance with Multithreading and Multicore Systems**

Application Programming Case Studies

- **Algorithm Development**—Counter-Controlled Iteration
- **Algorithm Development**—Sentinel-Controlled Iteration
- **Algorithm Development**—Nested Control Statements
- **Game Simulation**—Rock, Paper, Scissors
- **Random-Number Simulation**—Card Shuffling and Dealing
- **Random-Number Simulation**—The Tortoise and the Hare Race
- **Intro to Data Science**—Survey Data Analysis
- **Direct-Access File Processing**—Building a Transaction-Processing System
- **Visualizing Searching and Sorting Algorithms**—Binary Search and Merge Sort.
- **Artificial Intelligence/Data Science**—Natural Language Processing (“Who Really Wrote the Works of William Shakespeare?”)
- **Artificial Intelligence/Data Science**—Machine Learning with the GNU Scientific Library (“Statistics Can Be Deceiving” and “Have Average January Temperatures in New York City Been Rising Over the Last Century?”)
- **Game Programming**—Cannon Game with the raylib Library
- **Game Programming**—SpotOn Game with the raylib Library
- **Multimedia: Audio and Animation**—The Tortoise and the Hare Race with the raylib Library
- **Security and Cryptography**—Implementing a Vigenère Secret-Key Cipher and RSA Public-Key Cryptography
- **Animated Visualization with raylib**—The Law of Large Numbers
- **Web Services and the Cloud**—Getting a Weather Report Using libcurl and the OpenWeatherMap Web Services, and An Introduction to Building Mashups with Web Services.

Whether you're a student getting a sense of the textbook you'll be using, an instructor planning your course syllabus or a professional software developer deciding which chapters to read as you prepare for a project, the following chapter overviews will help you make the best decisions.

Part I: Programming Fundamentals Quickstart

Chapter 1, Introduction to Computers and C, engages novice students with intriguing facts and figures to excite them about studying computers and computer programming. The chapter includes current technology trends, hardware and software concepts and the data hierarchy from bits to databases. It lays the groundwork for the C programming discussions in Chapters 2–15, the appendices and the integrated case studies.

We discuss the programming-language types and various technologies you're likely to use as you develop software. We introduce the C standard library—existing, reusable, top-quality, high-performance functions to help you avoid “reinventing the wheel.” You'll enhance your productivity by using libraries to perform significant tasks while writing only modest numbers of instructions. We also introduce the **Internet**, the **World Wide Web**, the “**Cloud**” and the **Internet of Things (IoT)**, laying the groundwork for modern applications development.

This chapter's **test-drives** demonstrate how to compile and execute C code with

- **Microsoft's Visual C++** in Visual Studio on Windows,
- **Apple's Xcode** on macOS, and
- **GNU's gcc** on Linux.

We've run the book's 147 code examples using each environment.⁴ Choose whichever program-development environment you prefer—the book works well with others, too.

We also demonstrate **GNU gcc in the GNU Compiler Collection Docker container**. This enables you to run the latest **GNU gcc** compiler on Windows, macOS or Linux—this is important because the GNU compilers generally implement all (or most) features in the latest language standards. See the **Before You Begin** section that follows this Preface for compiler installation instructions. See the **Docker** section later in this Preface for more information on this important developer tool. For Windows users, we point to Microsoft's step-by-step instructions that allow you to install Linux in Windows via the **Windows Subsystem for Linux (WSL)**. This is another way to be able to use the **GNU gcc** compiler on Windows.

You'll learn just how big “**big data**” is and how quickly it's getting even bigger. The chapter closes with an introduction to **artificial intelligence (AI)**—a key overlap between the computer-science and data-science fields. AI and data science are likely to play significant roles in your computing career.

Chapter 2, Intro to C Programming, presents C fundamentals and illustrates key language features, including input, output, fundamental data types, computer memory concepts, arithmetic operators and their precedence, and decision making.

4. We point out the few cases in which a compiler does not support a particular feature.

Chapter 3, Structured Program Development, is one of the most important chapters for programming novices. It focuses on **problem-solving and algorithm development** with C's **control statements**. You'll **develop algorithms through top-down, stepwise refinement**, using the `if` and `if...else` selection statements, the `while` iteration statement for counter-controlled and sentinel-controlled iteration, and the increment, decrement and assignment operators. The chapter presents three algorithm-development case studies.

Chapter 4, Program Control, presents C's other **control statements**—`for`, `do...while`, `switch`, `break` and `continue`—and the logical operators. A key feature of this chapter is its **structured-programming summary**.

Chapter 5, Functions, introduces program construction using existing and custom functions as building blocks. We demonstrate **simulation techniques** with **random-number generation**. We also discuss passing information between functions and how the function-call stack and stack frames support the function call/return mechanism. We begin our treatment of recursion. This chapter also presents our first simulation case study—**Rock, Paper, Scissors**, which is enhanced by end-of-chapter exercises.

Part 2: Arrays, Pointers and Strings

Chapter 6, Arrays, presents C's built-in **array data structure** for representing lists and tables of values. You'll define and initialize arrays, and refer to their individual elements. We discuss passing arrays to functions, sorting and searching arrays, manipulating multidimensional arrays and creating variable-length arrays whose size is determined at execution time. **Chapter 13, Computer-Science Thinking: Sorting Algorithms and Big O**, discusses more sophisticated and higher-performance sorting algorithms and presents a friendly introduction to **analysis of algorithms** with computer science's **Big O** notation. Chapter 6 presents our first data-science case study—**Intro to Data Science: Survey Data Analysis**. In the exercises, we also present two **Game Programming with Graphics, Sound and Collision Detection** case studies and an **Embedded Systems Programming** case study (**Robotics with the Webots Simulator**).

Chapter 7, Pointers, presents what is arguably C's most powerful feature. Pointers enable programs to

- accomplish pass-by-reference,
- pass functions to other functions, and
- create and manipulate dynamic data structures, which you'll study in detail in **Chapter 12**.

The chapter explains pointer concepts, such as declaring pointers, initializing pointers, getting the memory address of a variable, dereferencing pointers, pointer arithmetic and the close relationship between arrays and pointers. This chapter presents our first systems software case-study exercise—**Building Your Own Computer with Simulation**. This case study introduces an essential modern computer-architecture topic—**virtual machines**.

Chapter 8, Characters and Strings, introduces the C standard library’s string, character and memory-block processing functions. You’ll use these powerful capabilities in **Chapter 11, File Processing**, as you work through a **natural language processing (NLP)** case study. You’ll see that strings are intimately related to pointers and arrays.

Part 3: Formatted Input/Output, Structures and File Processing

Chapter 9, Formatted Input/Output, discusses the powerful formatting features of functions `scanf` and `printf`. When properly used, these functions **securely** input data from the standard input stream and output data to the standard output stream, respectively.

Chapter 10, Structures, Unions, Bit Manipulation and Enumerations, introduces structures (`structs`) for aggregating related data items into custom types, unions for sharing memory among multiple variables, `typedefs` for creating aliases for previously defined data types, bitwise operators for manipulating the individual bits of integral operands and enumerations for defining sets of named integer constants. Many C programmers go on to study C++ and object-oriented programming. In C++, C’s `structs` evolve into `classes`, which are the “blueprints” C++ programmers use to create objects. C `structs` contain only data. C++ `classes` can contain data *and* functions.

Chapter 11, File Processing, introduces files for long-term data retention, even when the computer is powered off. Such data is said to be “persistent.” The chapter explains how plain-text files and binary files are created, updated and processed. We consider both sequential-access and random-access file processing. In one of our case-study exercises, you’ll read data from a comma-separated value (CSV) file. CSV is one of the most popular file formats in the data-science community. This chapter presents our next case study—**Building a Random-Access Transaction-Processing System**. We use random-access files to simulate the kind of high-speed direct-access capabilities that industrial-strength database-management systems have. This chapter also presents our first artificial-intelligence/data-science case study, which uses **Natural Language Processing (NLP)** techniques to begin investigating the controversial question, “Who really wrote the works of William Shakespeare?” A second artificial-intelligence/data-science case study—**Machine Learning with the GNU Scientific Library**—investigates Anscombe’s Quartet using simple linear regression.⁵ This is a collection of four dramatically different datasets that have identical or nearly identical basic descriptive statistics. It offers a valuable insight for students and developers learning some data-science basics in this computer-science textbook. The case study then asks you to run a simple linear regression on 126 years of New York City average January temperature data to determine if there is a cooling or warming trend.

5. “Anscombe’s Quartet.” Accessed November 13, 2020. https://en.wikipedia.org/wiki/Anscombe%27s_quartet.

Part 4: Algorithms and Data Structures

Chapter 12, **Data Structures**, uses structs to aggregate related data items into custom types, typedefs to create aliases for previously defined types, and **dynamically linked data structures** that can grow and shrink at execution time—**linked lists**, **stacks**, **queues** and **binary trees**. You can use the techniques you learn to implement other data structures. This chapter also presents our next systems-software case study exercise—**Building Your Own Compiler**. We'll define a simple yet powerful high-level language. You'll write some high-level-language programs that your compiler will compile into the machine language of the computer you built in Chapter 7. The compiler will place its machine-language output into a file. Your computer will **load** the machine language from the file into its memory, execute it and produce appropriate outputs.

Chapter 13, **Computer-Science Thinking: Sorting Algorithms and Big O**, introduces some classic computer-science topics. We consider several algorithms and compare their processor demands and memory consumption. We present a friendly introduction to computer science's **Big O notation**, which indicates how hard an algorithm may have to work to solve a problem, based on the number of items it must process. The chapter includes the case study **Visualizing the High-Performance Merge Sort**.

Our **recursion** (Chapter 5), **arrays** (Chapter 6), **searching** (Chapter 6), **data structures** (Chapter 12), **sorting** (Chapter 13) and **Big O** (Chapter 13) coverage provides nice content for a C data structures course.

Part 5: Preprocessor and Other Topics

Chapter 14, **Preprocessor**, discusses additional features of the C preprocessor, such as using `#include` to help manage files in large programs, using `#define` to create macros with and without arguments, using conditional compilation to specify portions of a program that should not always be compiled (e.g., extra code used only during program development), displaying error messages during conditional compilation, and using assertions to test whether expressions' values are correct.

Chapter 15, **Other Topics**, covers additional C topics, including multithreading support (available in GNU gcc, but not Xcode or Visual C++), variable-length argument lists, command-line arguments, compiling multiple-source-file programs, extern declarations for global variables in other files, function prototypes, restricting scope with `static`, makefiles, program termination with `exit` and `atexit`, suffixes for integer and floating-point literals, signal handling, dynamic memory-allocation functions `calloc` and `realloc` and unconditional branching with `goto`. This chapter presents our final case study—**Performance with Multithreading and Multicore Systems**. This case study demonstrates how to create multithreaded programs that will run faster (and often much faster) on today's multicore computer architectures. This is a nice capstone

case study for a book about C, for which writing high-performance programs is paramount.

Appendices

Appendix A, Operator Precedence Chart, lists C's operators in highest-to-lowest precedence order.

Appendix B, ASCII Character Set, shows characters and their corresponding numeric codes.

Appendix C, Multithreading/Multicore and Other C18/C11/C99 Topics, covers designated initializers, compound literals, type `bool`, complex numbers, additions to the preprocessor, the `restrict` keyword, reliable integer division, flexible array members, relaxed constraints on aggregate initialization, type generic math, inline functions, return without expression, `__func__` predefined identifier, `va_copy` macro, C11 headers, `_Generic` keyword (type generic expressions), `quick_exit` function, Unicode® support, `_noreturn` function specifier, type-generic expressions, Annex L: Analyzability and Undefined Behavior, memory-alignment control, static assertions, floating-point types and the `timespec_get` function.

Appendix D, Intro to Object-Oriented Programming Concepts, presents a friendly overview of object-oriented programming terminology and concepts. After learning C, you'll likely also learn one or more C-based object-oriented languages—such as C++, Java, C#, Objective-C or Swift—and use them side-by-side with C.

Online Appendices

Appendix E, Number Systems, introduces the binary, octal, decimal and hexadecimal number systems.

Appendices F–H, Using the Visual Studio Debugger, Using the GNU gdb Debugger and Using the Xcode Debugger, demonstrate how to use our three preferred compilers' basic debugging capabilities to locate and correct execution-time problems in your programs.

Key Features

C Programming Fundamentals

In our rich coverage of C fundamentals:

- We emphasize **problem-solving** and **algorithm development**.
- To help students prepare to work in industry, we use the terminology from the latest **C standard documents** in preference to general programming terms.
- We **avoid heavy math**, leaving it to upper-level courses. **Optional mathematical exercises** are included for science and engineering courses.

C11 and C18 Standards

C11 refined and expanded C’s capabilities. We’ve added more features from the C11 standard. Since C11, there has been only one new version, C18.⁶ It “addressed defects in C11 without introducing new language features.”⁷

Innovation: “Intro-to” Pedagogy with 350+ Integrated Self-Check Exercises

This book uses our new “Intro to” pedagogy with integrated Self Checks and answers. We introduced this pedagogy in our recent textbook, *Intro to Python for Computer Science and Data Science: Learning to Program with AI, Big Data and the Cloud*.

- Chapter sections are intentionally small. We use a “**read-a-little, do-a-little, test-a-little**” approach. You read about a new concept, study and execute the corresponding code examples, then test your understanding of the new concept via the integrated **Self-Check exercises immediately followed by their answers**. This will help you keep a brisk learning pace.
- **Fill-in-the-blank, true/false and discussion Self Checks** enable you to test your understanding of the concepts and terminology you’ve just studied.
- **Code-based Self Checks** give you a chance to use the terminology and reinforce the programming techniques you’ve just studied.
- The **Self-Checks** are particularly valuable for **flipped classroom** courses—we’ll soon say more about that popular educational phenomenon.

KIS (Keep It Simple), KIS (Keep it Small), KIT (Keep it Topical)

- **Keep it simple**—We strive for **simplicity and clarity**.
- **Keep it small**—Many of the book’s examples are small. We use more substantial code examples, exercises and projects when appropriate, particularly in the case studies that are a core feature of this textbook.
- **Keep it topical**—“*Who dares to teach must never cease to learn.*”⁸ (J. C. Dana)—In our research, we browsed, read or watched thousands of current articles, research papers, white papers, books, videos, webinars, blog posts, forum posts, documentation pieces and more.

6. ISO/IEC 9899:2018, Information technology — Programming languages — C, <https://www.iso.org/standard/74528.html>.

7. [https://en.wikipedia.org/wiki/C18_\(C_standard_revision\)](https://en.wikipedia.org/wiki/C18_(C_standard_revision)). Also http://www.iso-9899.info/wiki/The_Standard.

8. John Cotton Dana. From <https://www.bartleby.com/73/1799.html>: “In 1912 Dana, a Newark, New Jersey, librarian, was asked to supply a Latin quotation suitable for inscription on a new building at Newark State College (now Kean University), Union, New Jersey. Unable to find an appropriate quotation, Dana composed what became the college motto.—*The New York Times Book Review*, March 5, 1967, p. 55.”

Hundreds of Contemporary Examples, Exercises and Projects (EEPs)

You'll use a **hands-on applied approach** to learn from a broad selection of real-world **examples, exercises and projects (EEPs)** drawn from computer science, data science and other fields:

- You'll attack exciting and entertaining challenges in our larger case studies, such as building a survey-data-analysis program, building a transaction-processing system, building your own computer (using simulation to build a **virtual machine**), using **AI/data-science** technologies such as **natural language processing** and **machine learning**, building your own compiler, programming computer games, programming **robotics simulations** with **Webots**, and writing multithreaded code to take advantage of today's multicore computer architectures to get the best performance from your computer.
- **Research and project exercises** encourage you to go deeper into what you've learned and explore other technologies. We encourage you to use computers and the Internet to solve significant problems. Projects are often more extensive in scope than the exercises—some might require days or weeks of implementation effort. Many of these are appropriate for **class projects, term projects, directed-study projects, capstone-course projects** and **thesis research. We do not provide solutions to the projects.**
- Instructors can tailor their courses to their audience's unique requirements and vary labs and exam questions each semester.

Working with Open-Source Software

*In those days [batch processing] programmers never even documented their programs, because it was assumed that nobody else would ever use them. Now, however, time-sharing had made exchanging software trivial: you just stored one copy in the public repository and thereby effectively gave it to the world. Immediately people began to document their programs and to think of them as being usable by others. They started to build on each other's work.*⁹

—Robert Fano, Founding Director of MIT's Project MAC in the 1960s, which evolved into today's Computer Science and Artificial Intelligence Laboratory (CSAIL)¹⁰

Open source is software with source code that anyone can inspect, modify, and enhance."¹¹ We encourage you to try lots of **demos** and view free, **open-source** code examples (available on sites such as **GitHub**) for inspiration. We say more about GitHub in the section "Thinking Like a Developer—GitHub, StackOverflow and More."

9. Robert Fano, quoted in *Dream Machine: J.C.R. Licklider and the Revolution That Made Computing Personal* by Mitchell Waldrop. Penguin Putnam, 2002. p. 232.

10. "MIT Computer Science and Artificial Intelligence Laboratory." Accessed November 9, 2020. https://en.wikipedia.org/wiki/MIT_Computer_Science_and_Artificial_Intelligence_Laboratory.

11. "What is open source?" Accessed November 14, 2020. <https://opensource.com/resources/what-open-source>.

Visualizations

We include high-level **visualizations** produced with the **gnuplot** open-source visualization package to reinforce your understanding of the concepts:

- We use **visualizations** as a pedagogic tool. For instance, one example makes the **law of large numbers** “come alive” in a **dice-rolling simulation** (see **Chapter 10—Raylib Game Programming Case Studies** later in this Preface). As this program performs increasing numbers of die rolls, you’ll see each of the six faces’ (1, 2, 3, 4, 5, 6) percentage of the total rolls gradually approach 16.667% (1/6th), and the lengths of the bars representing the percentages equalize.
- You should experiment with the code to implement your own visualizations.

Data Experiences

In the book’s examples, exercises and projects—especially in the file-processing chapter—you’ll work with **real-world data** such as Shakespeare’s play *Romeo and Juliet*. You’ll download and analyze text from Project Gutenberg—a great source of free downloadable texts for analysis. The site contains nearly 63,000 e-books in various formats, including plain-text files—these are out of copyright in the United States. You’ll also work with real-world temperature data. In particular, you’ll analyze 126 years of New York City average January temperature data and determine whether there is a cooling or warming trend. You’ll get this data from National Oceanic and Atmospheric Administration (NOAA) website `noaa.gov`.

Thinking Like a Developer—GitHub, StackOverflow and More

*The best way to prepare [to be a programmer] is to write programs, and to study great programs that other people have written. In my case, I went to the garbage cans at the Computer Science Center and fished out listings of their operating systems.*¹²

—William Gates

- To help prepare for your career, you’ll work with such popular developer websites as **GitHub** and **StackOverflow**, and you’ll do Internet research.
- **StackOverflow** is one of the most popular developer-oriented, question-and-answer sites.
- There is a massive C open-source community. For example, on **GitHub**, there are over 32,000¹³ C code repositories! You can check out other people’s C code on GitHub and even build upon it if you like. This is a great way to learn and is a natural extension of our live-code teaching philosophy.¹⁴
- **GitHub** is an excellent venue for **finding free, open-source code** to incorporate into your projects—and for you to contribute your code to the **open-**

14. Students will need to become familiar with the variety of open-source licenses for software on GitHub.

source community if you like. Fifty million developers use GitHub.¹⁵ The site currently hosts over 100 million repositories for code written in an enormous number of languages¹⁶—developers contributed to 44+ million repositories in 2019 alone.¹⁷ **GitHub** is a crucial element of the professional software developer’s arsenal with **version control tools** that help teams of developers manage public open-source projects and private projects.

- In 2018, Microsoft purchased **GitHub** for \$7.5 billion. If you become a software developer, you’ll almost certainly use GitHub regularly. According to Microsoft’s CEO, Satya Nadella, they bought GitHub to “empower every developer to build, innovate and solve the world’s most pressing challenges.”¹⁸
- We encourage you to study and execute lots of developers’ open-source C code on GitHub.

Privacy

The ACM/IEEE’s curricula recommendations for Computer Science, Information Technology and Cybersecurity **mention privacy over 200 times**. Every programming student and professional needs to be acutely aware of privacy issues and concerns. Students research privacy in four exercises in Chapters 1, 3 and 10.

In Chapter 1’s exercises, you’ll start thinking about these issues by researching ever-stricter privacy laws such as **HIPAA (Health Insurance Portability and Accountability Act)** and the **California Consumer Privacy Act (CCPA)** in the United States and **GDPR (General Data Protection Regulation)** for the European Union.

Ethics

The ACM’s curricula recommendations for Computer Science, Information Technology and Cybersecurity mention ethics more than 100 times. In several Chapter 1 exercises, you’ll focus on ethics issues via Internet research. You’ll investigate privacy and ethical issues surrounding **intelligent assistants**, such as **IBM Watson**, **Amazon Alexa**, **Apple Siri**, **Google Assistant** and **Microsoft Cortana**. For example, a judge ordered Amazon to turn over Alexa recordings for use in a criminal case.¹⁹

Performance

Programmers prefer C (and C++) for performance-intensive operating systems, real-time systems, embedded systems, game systems and communications systems, so we **focus on performance issues**. We use **timing operations** in our multithreading exam-
