ALWAYS LEARNING

PEARSON

Prepare, Apply, and Confirm with MyFinanceLab™

- **eText Features**—Keep students engaged in learning on their own time, while helping them achieve greater conceptual understanding of course material through author-created solutions videos and animations.

- **Dynamic Study Modules**—Work by continuously assessing student performance and activity, then using data and analytics to provide personalized content in real time to reinforce concepts that target each student's particular strengths and weaknesses.

- **Hallmark Features**—Personalized Learning Aids, like Help Me Solve This, View an Example, and instant feedback are available for further practice and mastery when students need the help most!

- **Learning Catalytics**—Generates classroom discussion, guides lecture, and promotes peer-to-peer learning with real-time analytics. Now, students can use any device to interact in the classroom.

- **Adaptive Study Plan**—Assists students in monitoring their own progress by offering them a customized study plan powered by Knewton, based on Homework, Quiz, and Test results. Includes regenerated exercises with unlimited practice and the opportunity to prove mastery through quizzes on recommended learning objectives.

Prepare, Apply, and Confirm with MyFinanceLab™

- **Worked Solutions**—Provide step-by-step explanations on how to solve select problems using the exact numbers and data that were presented in the problem. Instructors will have access to the Worked Solutions in preview and review mode.

- **Algorithmic Test Bank**—Instructors have the ability to create multiple versions of a test or extra practice for students.

- **Financial Calculator**—The Financial Calculator is available as a smartphone application, as well as on a computer, and includes important functions such as cash flow, net present value, and internal rate of return. Fifteen helpful tutorial videos show the many ways to use the Financial Calculator in MyFinanceLab.

- **Reporting Dashboard**—View, analyze, and report learning outcomes clearly and easily. Available via the Gradebook and fully mobile-ready, the Reporting Dashboard presents student performance data at the class, section, and program levels in an accessible, visual manner.

- **LMS Integration**—Link from any LMS platform to access assignments, rosters, and resources, and synchronize MyLab grades with your LMS gradebook. For students, new direct, single sign-on provides access to all the personalized learning MyLab resources that make studying more efficient and effective.

- **Mobile Ready**—Students and instructors can access multimedia resources and complete assessments right at their fingertips, on any mobile device.

ABOUT THE AUTHOR

RAYMOND M. BROOKS is a Professor of Finance at Oregon State University. He has taught a variety of finance courses, including introduction to financial management, investments, advanced corporate finance, financial institutions, financial planning, and risk management. Previously, he taught at Washington University in St. Louis; the University of Southern Illinois, Edwardsville; and the University of Missouri–Columbia.

Professor Brooks has authored a variety of articles on topics from dividends to when-issued trading. He has twice won best papers awards at financial conferences.

Professor Brooks was a springboard diver for the Oregon State swim team and continues to enjoy swimming, hiking, music, reading, and watching OSU athletic teams.

THE STUDENT FRONT AND CENTER

Designed for the nonfinance major, *Financial Management: Core Concepts* structures a student-centric learning environment built around three major competencies:

- Using tools
- Making connections
- Studying for success

Using the Power Tools of Finance

EXAMPLE 4.2 Making retirement golden (present value of an annuity)

MyFinanceLab Video

Problem Ben and Donna determine that upon retirement they will need to withdraw \$50,000 annually at the end of each year for the next thirty years. They know that they can earn 4% each year on their investment. What is the present value of this annuity? In other words, how much will Ben and Donna need in their retirement account (at the beginning of their retirement) to generate this future cash flow?

Solution In this problem, we assume that Ben and Donna need to have the present value of the thirty-year annuity in their account at the start of their retirement, even though they will not make the first withdrawal of \$50,000 until the end of the first year of retirement. They will make thirty withdrawals from this account during retirement. The investment rate is 4%. It is the same as the discount rate for the future payments of \$50,000 that will come at the end of each year for the next thirty years. The known variables are $r = 4\%$, $n = 30$, and $PMT = \$50,000$. Solve for PV .

METHOD 1 Using the equation

First, calculate the PVIFA value for $n = 30$ and $r = 4\%$:

$$\frac{1 - [1/(1 + 0.04)^{30}]}{0.04} = \frac{[1 - (0.308319)]}{0.04} = 17.292033$$

Then multiply the annuity payment by this factor:

$$PV = \$50,000 \times 17.292033 = \mathbf{\$864,601.67}$$

Early TVM Tools. The author identifies the key concepts of finance as “tools.” Students first need to learn how to use these tools of finance before they can apply them to larger problems. That’s why the author drills down to basics quickly by developing time value of money (TVM) concepts and interest rates early in the course.

Figure 6.3 Future cash flow of the Merrill Lynch bond.

Later Application and Visual Links.

Students soon begin to see just how powerful these tools are. They learn to forge links between basic principles and new applications. A tool icon alerts students when a new tool is introduced and when a tool can be applied in a new situation.

We can set out the future cash flow as shown in Figure 6.3. Note that in the time line T_0 represents the original issue date of July 15, 2008, and T_1 is the first annual coupon payment date of July 15, 2009. The annual payments continue for ten years, with T_{10} being the last payment on July 15, 2018. This point is a moment of recognition in which we can apply previously learned concepts: the coupon payments constitute an annuity stream, the same amount at regular intervals. The principal or par value of \$1,000 also pays out at maturity. Here we recognize another key concept: the final amount is a lump-sum payment. So we now have the promised set of future cash flows for the Merrill Lynch bond.

Problem Solving: Technology Tools and the Three-Methods Approach

The author helps students develop their skills in problem solving by using a three-pronged approach that shows there are several paths to the same destination.

EXAMPLE 3.4 Let's make a deal! (future value)

Problem In 1867, Secretary of State William H. Seward purchased Alaska from Russia for the sum of \$7,200,000, or about two cents per acre. At the time, the deal was dubbed Seward's Folly, but from our vantage point today, did Seward get a bargain after all? What would it cost today if the land were in exactly the same condition as it was 148 years ago and the prevailing interest rate over this time were 4%?

Solution At first glance, it seems as if we have a present value problem, not a future value problem, but it all depends on where we are standing in reference to time. Phrasing this question another way, we could ask, "What will the value of \$7,200,000 be in 148 years at an annual interest rate of 4%?" Restated this way, we can more easily view the problem as a future value problem. A time line is particularly helpful in this instance. We can show the 148-year span from T_{-148} to T_0 or from T_0 to T_{148} .

Equation. He presents the equation and solves the problem mathematically.

METHOD 1 Using the equation

$$FV = PV \times (1 + r)^n = \$7,200,000 \times 1.04^{148} \\ = \$7,200,000 \times 313.8442 = \$2,389,278,156$$

Calculator. He then solves the problem using a financial calculator, explaining the key strokes. The answer is displayed in red on the appropriate calculator key.

METHOD 2 Using the TVM keys

Input	148	4.0	-7,200,000	0	?
Key	N	I/Y	PV	PMT	FV
CPT					2,389,278,156

Spreadsheet. For some examples, an Excel® solution is added. The author explains the basic spreadsheet variables and how to set up the application.

METHOD 3 Using a spreadsheet

B6	fx =FV(B1,B2,B3,B4,B5)				
Use the future value function to find the price of Alaska if purchased today instead of 148 years ago.					
	A	B	C	D	E
1	Rate	0.04			
2	Nper	148			
3	Pmt	0			
4	Pv	(\$ 7,200,000.00)			
5	Type	0			
6	Fv	\$2,389,278,156			

The Overall Intent? To develop in the student an intuition about which problem-solving approach works best for a particular problem—in other words, to develop an informed “do-it-yourself” attitude toward the tools of technology.

Making Connections

With the Real World. “Finance Follies” capture some fascinating examples of current and historical scandals and manias and give the student context for the necessity of studying finance.

FINANCE FOLLIES

The Financial Meltdown of 2008

Between October 2007 and October 2008, financial markets in the United States lost more than 40% of their value, and several financial institutions collapsed or were swallowed up by healthier firms. This “perfect storm” of mortgage defaults, a housing market collapse, lack of appropriate regulation and oversight, and a major international credit freeze led to the worst financial meltdown since the Great Depression of the 1930s.

We can find the seeds of this financial debacle in the housing market, but the soil in which they were planted had been prepared for a long time. In the 1980s, a new philosophy that the capital markets worked best when regulations were removed became the prevailing paradigm. Over the next twenty years, a slow and deliberate dismantling of regulations surrounding the financial markets took place. The central ideas behind this deregulation were that government is the problem rather than the solution and that if we remove the government from the market, free competition will efficiently allocate resources for a stronger economy.

A key catalyst for the meltdown was the dismantling of the Glass-Steagall Act (officially called the Banking Act of 1933). In 1999, the Gramm-Leach-Bliley Act overturned segments of Glass-Steagall that

dream that they thought they might never realize—a new home—but the new home often brought with it an unconventional loan. The industry collectively called these unconventional loans “subprime” loans because the initial monthly payment on the loan in the first few years was well below that of a conventional mortgage loan. The interest rate on subsequent payments, however, would increase well above that of a standard loan. So a new homeowner might enjoy relatively low mortgage payments in the first couple of years only to face a large increase when the financial institution reset the interest rate. In many of these loans, the cost jumped by more than \$500 per month.

When the loan payments jumped, many mortgage holders could no longer afford to stay in their homes. The default rate rose to over 20% on these loans, which is much higher than the typical 1% to 3% default rate on conventional loans. Normally, the bank would simply repossess the home, sell it, and recover the loan. But with a glut of houses on the market, the housing market collapsed, and prices fell. The banks could not sell these houses at any price near the value of the loan.

In addition, knowing that the potential for default was higher on these subprime loans, many banks par-

FINANCE FOLLIES

“Dangerous to Your Wealth”: Is Investing Just Gambling?

In the classic 1994 film *Forrest Gump*, the intellectually challenged hero becomes fabulously rich after making early investments in “some fruit company” that turns out to be Apple. As you read this chapter, many of you may wonder whether careful calculations of risk and return are any more likely to lead to successful investments than mere instinct and hunches. Isn’t investing just a form of gambling anyway?

Investors and gamblers approach risk and return in fundamentally different ways:

1. *In gambling, the odds are against you; in investing, they are in your favor.* Except for poker, the gambler plays against the house. If you sit at the casino table long enough, you are guaranteed to lose money. If you invest long enough in the stock markets, however, you can earn (historically speaking) roughly 6% to 10% a year.
Even if you’re clever enough to get to the point that you can count the cards and start to win more consistently in gambling, you’ll find yourself banned from the casino. The house wants only players who are willing to go up against the mathematical odds, not players with skill. Vegas wasn’t built on winners.
2. *Gamblers seek fast gains; investors are (usually) patient.* Gamblers want instant gratification and

hope for a high return in a short time, which is a possible, but unlikely outcome. Investors realize that investing is a long-term effort that allows for time to grow money and make adjustments along the way. In general, gamblers want to double or triple their money quickly, but that rarely happens. It *can* happen with a slower investment process in which time builds value. Although some investors do treat the market like a casino through speculative investments, most do not and choose the duller, but safer route of long-term investing.

3. *In gambling, if you lose, your money is gone; in investing, when share prices fall, you still own the stock.* Games of chance are all or nothing. If you lose, you lose 100% of what you bet. Investment losses are usually partial and often temporary. Unless every company in your portfolio goes bankrupt, you will not lose all your money.

In a nutshell, investing is a matter of skill, and gambling is a matter of luck. Therefore, no rational person will use gambling as more than entertainment. The risk-and-return models that you will study in this chapter really do make sense. In the final analysis, gambling can be dangerous to your wealth, but prudent investing can enhance it.

With Careers. “Putting Finance to Work” answers a question students often ask: “Why do I need to take a finance course, anyway?” These snapshots of widely varied careers show that specific finance concepts are used in many different career paths.

PUTTING FINANCE TO WORK

Information Technology

The quality of short-term financial plans and forecasts depends completely on the quality of information that goes into them. The cash flow forecast requires us to know what inventory we have on hand, where it is, how long we expect to hold it before we sell it, and how long it takes us to replace it. It requires us to know how much money our customers owe us and when we expect them to pay. The sales forecast requires data on what we sold recently, what we sold in the same period last year, and what trends are developing. For a company like McDonald’s that handles thousands of transactions a minute in every corner of the globe, an apparently simple question such as “How much cash do we have on hand?” is not that simple.

protecting, transmitting, and retrieving such information lie in the realm of information technology, or IT. Those who work in the management of information go by many names, including systems analysts, business analysts, information technology specialists, information managers, and database managers. Whatever we call them, their role is critical to an organization’s financial management.

They design, develop, implement, and support the systems that make this information usable, retrievable, and secure. Depending on their area of specialization, they may design or adapt software to specific requirements, and they can play a key role in choosing and supporting hardware to run the systems. Because they work closely with managers and staff in the major business functions such as marketing, operations, accounting, and finance, IT specialists must have a good understanding of those functions and their needs. Often, different functions such as finance and marketing will need the same information, but in different formats.

These data requirements present a challenge even for relatively uncomplicated businesses that manufacture just a few products like furniture or that retail a single product like automobiles. For a company such as Procter and Gamble that manufactures an array of consumer products from many different raw materials in many locations or for a retailer such as CVS or Walgreen’s that seems to sell everything from alarm clocks to zinc tablets, the problem stretches the imagination. Without such information, our plans and forecasts are little more than a shot in the dark.

Fortunately, financial executives can usually retrieve accurate and timely data with a few keystrokes or clicks of the mouse. Business software can produce many types of

College students who major in computer science, computer engineering, or management information systems prepare for careers in information technology. Some schools offer information technology as a concentration within the business major. These programs, and others with similar names, overlap considerably, but computer science and computer engineering programs usually re-

With Different Kinds of Businesses. “Mini-Cases” at the end of every chapter put abstract concepts to work in the types of organizations for which students will later work. The cases feature small businesses, large corporations, town organizations, and start-ups.

MINI-CASE

Richardses’ Tree Farm, Inc.: The Continuing Saga

This mini-case is available in MyFinanceLab.

Richardses’ Tree Farm, Inc. is doing well after its incorporation. Jake Richards, president, chief of operations, and majority shareholder, currently has a planting of 10,000 three-year-old Japanese dogwood trees in a recently introduced pink-flowered variety. Richards can sell this type of tree at a higher price than the more common white-flowered variety. The trees are now 6 feet tall on average and can command \$24 each. At present, Richards has priced 8-foot trees at \$34 and 10-foot trees at \$40. Landscape contractors avoid trees larger than 10 feet tall because they are difficult to transplant successfully. With average weather, the 6-foot trees will be 8 feet tall in three years and 10 feet tall in six years.

Jake has to make financial decisions almost every day. Today’s decision involves present value and future value computations, which Jake learned as a student at Oregon State University. He wants to know if he should sell the trees immediately at 6 feet tall, three years from now at 8 feet tall, or six years from now at 10 feet tall.

Size	Age	Current Market Value
6'	3 years	\$24.00
8'	6 years	\$34.00
10'	9 years	\$40.00

Questions

- Because of inflation, Jake expects the price at which he can sell the trees to increase by 3% per year. What price does he expect to receive if he keeps the trees until they reach 8 feet or 10 feet tall?
- If Jake discounts the future price of the trees at 10% per year, what is the present value of their future prices?
- Using the time value of money equation, compute the growth rate of the trees between the third year and the sixth year and between the sixth year and the ninth year.
- When should Jake sell the trees?
- Challenge question.** A major landscape contractor who has bid successfully on a large-scale Boston beautification and urban greening project has offered to buy all 10,000 flowering dogwood trees at a price of \$28,000, payable immediately. However, the contractor does not need the trees for three years. If Jake accepts, he will be obliged to deliver 10,000 trees three years from today. If anything should happen to his own crop, he would need to buy trees on the open market at the prevailing price, which might be higher or lower than the price estimated in Question 1. Should Jake accept the offer if his required rate of return is 10%? *Hint:* What is the present value of the price he expects to receive for the trees three years in the future?

THE STUDENT FRONT AND CENTER

Studying for Success

For the Student on the Go. Tear-out Summary Cards for every chapter provide instantaneous mini-reviews. In addition to summarizing the main points of the chapter, these portable study aids include mathematical notation, calculator keys, and key equations, all great to read over right before an exam!

CHAPTER 3

The Time Value of Money (Part 1)

AT A GLANCE

LO1 Calculate future values and understand compounding.
 Future value is the value of an asset at a specific point in time in the future that is equivalent in value to a specific amount today. There is a direct relationship between the future value of an asset and the asset's present value, growth rate, and time to the future point. Future values grow faster and faster due to interest earning interest, a phenomenon called compounding of interest.

LO2 Calculate present values and understand discounting.
 Present value is the value today of tomorrow's cash flow. You can determine the equivalent value of a future value in today's dollars by discounting the future value back to the present.

For Students with Test Anxieties. "Prepping for Exams" is designed for those students who worry about how well they will do on the finance exam. To build confidence and expose students to the types of problems they will see on some exams, multiple-choice questions at the end of each chapter are pulled directly from the test bank. Answers are printed in the back of the book in Appendix 5.

PREPPING FOR EXAMS

- Five years ago Thompson Tarps, Inc. issued twenty-five-year 10% annual coupon bonds with a \$1,000 face value. Since then, interest rates in general have risen, and the yield to maturity on the Thompson Tarps bonds is now 12%. Given this information, what is the price today for a Thompson Tarps bond?
 - \$843.14
 - \$850.61
 - \$1,181.54
 - \$1,170.27
- Endicott Enterprises, Inc. has issued thirty-year semiannual coupon bonds with a face value of \$1,000. If the annual coupon rate is 14% and the current yield to maturity is 8%, what is the firm's current price per bond?

For the Student Who Wants Practice. The book features approximately 400 end-of-chapter problems and 180 conceptual questions. Advanced spreadsheet problems appear at the end of most chapters for more flexibility in assigning problems for individuals or teams.

KEY TERMS

compounding, p. 89
 compound interest, p. 84
 discounting, p. 89
 discount rate, p. 89
 future value (FV), p. 83
 future value interest factor
 growth rate, p. 85

QUESTIONS

- What is the time value of money?
- Discuss the equation method used to determine future values. What is compound interest?
- What is a growth rate? What is a discount rate? What is a future value?
- How can the investor determine the present value of a future value?

PROBLEMS

- Future values.** Fill in the future values for the following table:
 - using the future value formula, $FV = PV \times (1 + r)^n$.
 - using the TVM keys or function from a calculator or spreadsheet.

Present Value	Interest Rate	Number of Periods	Future Value
\$ 400.00	5.0%	5	
\$ 17,411.00	6.0%	30	
\$35,000.00	10.0%	20	

ADVANCED PROBLEMS FOR SPREADSHEET APPLICATION

- Future value of a portfolio.** Rachel and Richard want to know when their current portfolio will be sufficient for them to retire. They have the following balances in their portfolio:
 - Money market account: \$37,000
 - Government bond mutual fund: \$140,000
 - Large capital mutual fund: \$107,000
 - Small capital mutual fund: \$71,000
 - Real estate trust fund: \$87,000
 Rachel and Richard believe they need at least \$2,000,000 to retire. The money market account grows at 2.5% annually, the government bond

For the Visual Student. Illustrations with a Purpose help students visualize important financial concepts. The time line is given special treatment in the all-important time value of money and capital budgeting chapters. To depict movement, present value is always in a lighter shade and future value in a darker shade, and PV is always on the left and FV always on the right. This setup makes it easier to see compounding from the present into the future and discounting “back from the future” to the present.

Figure 3.1 Time lines of growth rates (top) and discount rates (bottom) illustrate present value and future value.

Graphic illustrations are occasionally presented as another way of “seeing” a concept. All illustrations say something about finance.

For the Student Who Wants More Practice. **MyFinanceLab**, a fully integrated online home and tutorial system, enables students to complete problems and receive immediate feedback and help. **MyFinanceLab** also has a special section of spreadsheet problems for Chapters 2 through 18 that provide an opportunity to work more data-intensive problems with spreadsheet applications. See the front endpapers for more details on **MyFinanceLab**.

RESOURCES FOR THE INSTRUCTOR

Instructor's Manual

Written by Jim DeMello of Western Michigan University, the Instructor's Manual contains the following for each chapter:

- Answers and solutions to all end-of-chapter questions and problems
- Big-picture overviews
- Lecture launchers, often with real-world examples of the chapter concepts
- Chapter outlines, suitable as lecture notes, with appropriate PowerPoint slides referenced
- Trouble spots or pitfalls that students often encounter
- Additional examples and homework problems with worked-out solutions

PowerPoint Presentation

Prepared by Jim DeMello of Western Michigan University, the PowerPoint presentation includes lecture outlines, with equations and examples on separate slides; an assortment of new worked-out examples to provide fresh input on key points; and all chapter figures.

Computerized Test Bank

Written by Curt Bacon of Southern Oregon University and checked for accuracy by Michael J. Woodworth, the computerized test bank features approximately 1,800 questions and solutions broken down by chapter into multiple-choice questions of conceptual and numeric types, true-or-false questions, and short-essay questions. The test bank is written in TestGen, an easy-to-use testing software program that allows instructors to view, edit, and add questions. It is also available in MyFinanceLab.

MyFinanceLab

MyFinanceLab, a fully integrated online homework and tutorial system, enables students to complete problems and receive immediate feedback and help. See the front endpapers for details.

WITH THE ENCOURAGEMENT of Donna Battista and a wonderful set of individuals at Pearson, our team started out on the journey of writing this textbook. We are now in the third edition of a process that has been a great adventure. The first and second editions were very successful, and our audience (student users), reviewers, and adopters provided some insightful suggestions for this third edition. But the general concepts and approach to the book have remained true to the original design we followed in the first edition.

What's New in the Third Edition

- Of course, we have updated the material that was time-related. For example, the interest rates now reflect the historically low levels of the first decade of the twenty-first century.
- Additionally, we have continued to strengthen the Chapter 12 material on cash flow.
- We have increased the coverage on cash flow management in Chapter 13.
- We have provided additional insight on ratio analysis in Chapter 14 so that the temporal nature of these ratios is more apparent.
- We have added a new tear-out Summary Card of key formulas and spreadsheet functions following the chapter Summary Cards at the back of the book.
- The third edition MyFinanceLab course will include an enhanced eText with animated figures and author-created solutions videos for in-text examples.

We began with a simple concept. When a student takes an introductory finance class, he or she may encounter a wonderful instructor with great teaching talent and insight. But outside of class, it is the book and the support materials with which the student forms a learning partnership. *Therefore, the book and support materials need to put the student front and center.* They need to present the information in such a way that it connects directly to the student's experiences. So our goal in this book is to introduce the core concepts of finance in a way that reconnects the student to his or her personal financial experiences, provides student-centered feedback in a timely and understandable fashion, and then uses such experiences as a springboard into the world of corporate finance.

The introductory finance class is the first and last class in finance for the vast majority of college students. The perspective of these students often differs from that of students majoring in finance. They need a book that shows why finance matters across disciplines and that builds from the basics to more complex topics in an organic approach. Our purpose throughout the presentation of topics has been to make the material as simple as possible, but not overly simplified. It is this balance that we hope creates a solid foundation for the fundamental concepts of finance for *all* students.

The evolution of technical support for finance has been amazing. Students now have advanced calculators and spreadsheet software that can provide solutions to many of the basic financial problems. However, understanding finance is more than just solving a financial problem with the aid of these technological

tools. These different tools are all interconnected, and students who can move seamlessly from one to another gain a better understanding of the basics behind the answer. So the book presents three methods to solve many financial problems: the equation approach, the calculator approach, and the spreadsheet approach. In this way, students see that there are different roads to the same destination.

The evolution of technical support has also been great for the instructor. MyFinanceLab has been developed to provide the extra support that time constraints often prevent an instructor from providing to students. With every end-of-chapter problem formatted in MyFinanceLab, an instructor can assign a text-related problem that students solve online with technical support. The problem's solution is available to students, and the marking of individual student homework assignments is completed by MyFinanceLab. In addition, MyFinanceLab has features such as Help Me Solve This, which leads students step by step through the problem with a different set of numbers.

The student is at the heart of this book. Our hope is that we have made the path easier and finance more transparent.

ACKNOWLEDGMENTS

I OWE A GREAT DEAL OF GRATITUDE to the many people who helped create this book.

First, I would like to thank the marvelous people at Pearson Education, especially the editors on the first edition of the text: development editor Mary Clare McEwing and Donna Battista, Vice President, Business Publishing. Mary Clare and Donna were great supporters and contributors from the inception of the first edition to final production. For the third edition, I owe much gratitude to acquisitions editor Kate Fernandes and program manager Kathryn Dinovo. All of these individuals have put as much love into the book as I have.

Carla Thompson and Jeff Holcomb of Pearson and Heidi Allgair of Cenveo® Publisher Services, along with the rest of the team at Cenveo, pulled off a superb production job. I also salute Miguel Leonarte and Melissa Honig of Pearson for the technological expertise they brought to the product, particularly in the development of the MyFinanceLab and the Web site for the book. Jerilyn Bockorick of Cenveo Publisher Services did a magnificent job on the interior design and gave us a splendid cover. My marketing manager, Maggie Moylan, spent productive time in talks with me, coaxing out the differential advantages of the book and putting all to use in a terrific marketing campaign.

I am particularly grateful to Robert Hartwig of Worcester State College for his creative work on the “Putting Finance to Work” boxes, the “Finance Follies” snapshots, and the “Mini-Cases” at the end of each chapter. Bob has been a great contributor to the project, although he did not know at the beginning how rich the source material would be for the “Finance Follies” boxes!

I have been most fortunate in having a talented team of supplement authors on this project. Curt Bacon of Southern Oregon University did an excellent job on the test bank, and Jim DeMello of Western Michigan University made great contributions with his authorship of the Instructor’s Manual and PowerPoint slides. I would also like to single out Joe Walker of the University of Alabama at Birmingham, who did a meticulous job of reviewing the chapters for accuracy and checking the end-of-chapter solutions in the Instructor’s Manual, as well as Michael J. Woodworth, who reviewed the test bank for accuracy. Also, a special thank-you to Kevin Thorpe, one of my teaching assistants, who helped with the solutions to the end-of-chapter questions and problems.

All the reviewers of the book—and there were many—provided exceptional insights for improving the various drafts, adding new dimensions to the chapters, and pointing out new directions to explore. I am most grateful to these instructors for lending their time and expertise to this project; their names appear on the following pages.

I cannot sufficiently thank those who inspired this book: my students at Oregon State University. Hundreds of them used the book in preliminary form and provided valuable feedback on all aspects of the presentation. I will forever be grateful for their patience and understanding.

Finally, I thank my wife, Greta, for her endless support and encouragement.

To all these people, my profound thanks. Your countless contributions have made for a better book and the writing of it all worthwhile.

Raymond M. Brooks

PART ONE

Fundamental Concepts and Basic Tools of Finance

Financial Management

In this text, we embark on a journey of the study of finance and financial management. It is probably your first trip through these uncharted waters, but you may already have an intuitive understanding of certain aspects of finance. If you have saved money, borrowed money, or loaned money, you have performed a fundamental activity of finance. Your intuition should serve you well as you develop your personal skill set for finance and financial management.

In this chapter, you will learn about finance activities, the main areas of finance, the key financial players, and the types of business organizations. Together, we'll examine the relationship of a company's officers to its

LEARNING OBJECTIVES

L01

Describe the cycle of money, the participants in the cycle, and the common objective of borrowing and lending.

L02

Distinguish the four main areas of finance and briefly explain the financial activities that each encompasses.

L03

Explain the different ways of classifying financial markets.

L04

Discuss the three main categories of financial management.

L05

Identify the main objective of the finance manager and how he or she might meet that objective.

L06

Explain how the finance manager interacts with both internal and external players.

L07

Delineate the three main legal categories of business organizations and their respective advantages and disadvantages.

L08

Illustrate agency theory and the principal-agent problem.

L09

Define issues in corporate governance and business ethics.
